## INSTRUGTION MANUAL <br> TEC@ <br> UNVERTER

## Table of Contents

Preface ..... 0-1
Chapter 1 Safety Precautions ..... 1-1
1.1 Before Supplying Power to the Inverter ..... 1-1
1.2 Wiring ..... 1-1
1.3 Before Operation ..... 1-2
1.4 Parameters Setting ..... 1-2
1.5 Operation ..... 1-2
1.6 Maintenance, Inspection and Replacement ..... 1-3
1.7 Disposal of the Inverter ..... 1-3
1.8 Guaranteed liability exemption ..... 1-3
Chapter 2 Model Description ..... 2-1
2.1 Nameplate Data ..... 2-1
2.2 Model Identification ..... 2-1
Chapter 3 Environment and Installation ..... 3-1
3.1 Environment ..... 3-1
3.2 Installation ..... 3-2
3.2.1 Installation Spaces ..... 3-2
3.2.2 External View ..... 3-3
3.2.2.1 External View (IP00/ IP20) ..... 3-3
3.2.2.2 External View (IP55) ..... 3-6
3.2.3 Warning Labels ..... 3-7
3.2.4 Removing the Front Cover and Keypad ..... 3-8
3.2.4.1 Standard Type (IP00/IP20) ..... 3-9
3.2.4.2 Built-in Filter Type (IP20/IP00) ..... 3-16
3.2.4.3 Water proof Type (IP55) ..... 3-18
3.3 Inverter Wiring ..... 3-20
3.3.1 Wire Gauges and Tightening Torque ..... 3-20
3.3.2 Wiring Peripheral Power Devices ..... 3-22
3.3.3 General Wiring Diagram ..... 3-24
3.3.3.1 General Wiring Diagram (For Standard H \& C type) ..... 3-24
3.3.3.2 General Wiring Diagram (For Enhanced E \& G type) ..... 3-25
3.3.4 Single/ Multi- Pump Dedicated Wiring Diagram ..... 3-26
3.3.4.1 For Standard H \& C type ..... 3-26
3.3.4.2 For Enhanced E \& G type ..... 3-29
3.3.5 Wiring for Control Circuit Terminals ..... 3-32
3.3.5.1 Wiring for Control Circuit Terminals (For Standard H \& C type) ..... 3-32
3.3.5.2 Wiring for Control Circuit Terminals (For Enhanced E \& G type) ..... 3-35
3.3.6 Wiring for Main Circuit Terminals ..... 3-38
3.3.6.1 Wiring for Main Circuit Terminals (For Standard H \& C type) ..... 3-38
3.3.6.2 Wiring for Main Circuit Terminals (For Enhanced E \& G type) ..... 3-43
3.3.7 Wiring Precautions ..... 3-54
3.3.8 Input Power and Cable Length ..... 3-56
3.4 Inverter Specifications ..... 3-57
3.5 Inverter De-rating Based on Carrier Frequency ..... 3-61
3.6 Inverter De-rating Based on Temperature ..... 3-65
3.7 Inverter Dimensions ..... 3-66
3.7.1 Standard Type (IP00/IP20) ..... 3-66
3.7.2 Standard Type with Built-in Filter (IP00/IP20) ..... 3-75
3.7.3 Water proof Type (IP55) ..... 3-77
Chapter 4 Keypad and Programming Functions ..... 4-1
4.1 LED Keypad ..... 4-1
4.1.1 Keypad Display and Keys ..... 4-1
4.1.2 Seven Segment Display Description ..... 4-3
4.1.3 LED Indicator Description ..... 4-5
4.1.4 Power-up Monitor ..... 4-7
4.1.5 Modifying Parameters/ Set Frequency Reference ..... 4-8
4.1.6 Operation Control ..... 4-10
4.2 LCD keypad ..... 4-11
4.2.1 Keypad Display and Keys ..... 4-11
4.2.2 Keypad Menu Structure ..... 4-13
4.3 Parameters ..... 4-17
4.4 Description of Parameters ..... 4-71
4.5 Built-in PLC Function ..... 4-309
4.5.1 Basic Command ..... 4-309
4.5.2 Basic Command Function ..... 4-310
4.5.3 Application Functions ..... 4-311
4.6 Modbus Protocol Descriptions ..... 4-319
4.6.1 Communication Connection and Data Frame ..... 4-319
4.6.2 Register and Data Format ..... 4-323
4.7 BacNET Protocol Descriptions ..... 4-343
4.7.1 BACnet Services ..... 4-343
4.7.2 BACnet Protocol Structure ..... 4-344
4.7.3 BACnet Specifications ..... 4-345
4.7.4 BACnet Object Properties ..... 4-346
4.8 MetaSys N2 Communication Protocol ..... 4-349
4.8.1 Introduction and Setting ..... 4-349
4.8.2 MetaSys N2 Specification ..... 4-349
4.8.3 Definition of MetaSys N2 Communication Protocol ..... 4-350
4.8.4 MetaSys N2 Communication Protocol in F510 Model ..... 4-351
Chapter 5 Check Motor Rotation and Direction ..... 5-1
Chapter 6 Speed Reference Command Configuration ..... 6-1
6.1 Reference from Keypad ..... 6-1
6.2 Reference from External Analog Signal (0-10V / 4-20mA) ..... 6-2
6.3 Reference from Serial Communication RS485 (00-05=3) ..... 6-4
6.4 Reference from two Analog Inputs ..... 6-6
6.5 Change Frequency Unit from Hz to rpm ..... 6-6
Chapter 7 Operation Method Configuration (Run I Stop) ..... 7-1
7.1 Run/Stop from the Keypad (00-02=0) - Default Setting ..... 7-1
7.2 Run/Stop from External Switch / Contact or Pushbutton (00-02=1) ..... 7-2
7.3 Run/Stop from Serial Communication RS485 (00-02=3) ..... 7-3
Chapter 8 Motor and Application Specific Settings ..... 8-1
8.1 Set Motor Nameplate Data (02-01, 02-05) ..... 8-1
8.2 Acceleration and Deceleration Time (00-14, 00-15) ..... 8-2
8.3 Torque Compensation Gain (01-10) ..... 8-3
8.4 Automatic Energy Savings Function (11-19) ..... 8-4
8.5 Emergency Stop ..... 8-6
8.6 Direct / Unattended Startup ..... 8-7
8.7 Analog Output Setup ..... 8-8
Chapter 9 Using PID Control for Constant Flow / Pressure Applications ..... 9-1
9.1 What is PID Control? ..... 9-1
9.2 Connect Transducer Feedback Signal (10-01) ..... 9-3
9.3 Engineering Units ..... 9-4
9.4 Sleep / Wakeup Function ..... 9-5
Chapter 10 Troubleshooting and Fault Diagnostics ..... 10-1
10.1 General ..... 10-1
10.2 Fault Detection Function ..... 10-1
10.3 Warning / Self-diagnosis Detection Function ..... 10-7
10.4 Auto-tuning Error ..... 10-15
10.5 PM Motor Auto-tuning Error ..... 10-16
10.6 General troubleshooting ..... 10-17
10.7 Troubleshooting of the Inverter ..... 10-18
10.7.1 Quick troubleshooting of the Inverter ..... 10-18
10.7.2 Troubleshooting for OC, OL error displays ..... 10-20
10.7.3 Troubleshooting for OV, LV error ..... 10-21
10.7.4 The motor can not run ..... 10-22
10.7.5 Motor Overheating ..... 10-23
10.7.6 Motor runs unbalanced ..... 10-24
10.8 Routine and periodic inspection ..... 10-25
10.9 Maintenance ..... 10-26
Chapter 11 Inverter Peripheral devices and Options ..... 11-1
11.1 Braking Resistors and Braking Units ..... 11-1
11.2 AC Line Reactors ..... 11-5
11.3 Input Noise Filters ..... 11-7
11.4 Input Current and Fuse Specifications ..... 11-9
11.5 Other options ..... 11-11
11.6 Communication options ..... 11-16
11.7 Others Options ..... 11-17
11.8 NEMA1 Kit ..... 11-18
11.9 PROFIBUS high speed communication expansion card ..... 11-19
11.9.1 Communication hardware and data structure ..... 11-19
11.9.2 Product specifications ..... 11-20
11.9.3 Installation instructions ..... 11-21
11.9.4 LED indicator descriptions ..... 11-23
11.9.5 Driver parameter setting descriptions ..... 11-24
11.9.6 Connection instructions ..... 11-24
11.9.7 Meanings of each character ..... 11-25
11.9.8 PKW regional access parameters ..... 11-26
11.9.9 Troubleshooting ..... 11-28
11.9.10 GSD File ..... 11-29
11.10 CANopen high speed communication expansion card ..... 11-30
11.10.1 Communication hardware and data structure ..... 11-30
11.10.2 Product specifications ..... 11-31
11.10.3 Installation instructions ..... 11-32
11.10.4 Transmission rate, maximum transmission distance and cable length ..... 11-34
11.10.5 LED indicator descriptions ..... 11-34
11.10.6 Driver parameter setting descriptions ..... 11-35
11.10.7 Connection instructions ..... 11-35
11.10.8 Object index list ..... 11-37
11.10.9 Troubleshooting ..... 11-42
11.10.10 EDS file. ..... 11-43
11.11 Introduction to the EtherCAT high speed communication expansion module. ..... 11-44
11.11.1 Communication hardware and data structure ..... 11-44
11.11.2 Product specifications ..... 11-45
11.11.3 Installation instructions ..... 11-45
11.11.4 LED indicator descriptions ..... 11-46
11.11.5 Object index list ..... 11-47
11.11.6 Troubleshooting ..... 11-49
11.11.7 xml file ..... 11-49
11.12 I/O expansion card ..... 11-50
11.12.1 Hardware and data structure ..... 11-50
11.12.2 Product specifications ..... 11-50
11.12.3 Installation instructions ..... 11-51
11.12.4 Driver parameter setting descriptions ..... 11-51
11.13 DC reactor ..... 11-52
11.14 Sinusoidal output reactor ..... 11-54
11.15 DC24V power expansion card ..... 11-56
11.15.1 JN5-PS-DC24V Product specifications ..... 11-56
Appendix-A Instructions for UL ..... A-1

## Preface

The F510 product is an inverter designed to control a three-phase induction motor. Please read this manual carefully to ensure correct operation, safety and to become familiar with the inverter functions.

The F510 inverter is an electrical / electronic product and must be installed and handled by qualified service personnel.

Improper handling may result in incorrect operation, shorter life cycle, or failure of this product as well as the motor.

All F510 documentation is subject to change without notice. Be sure to obtain the latest editions for use or visit our website at http://industrialproducts.teco.com.tw/.

Available Documentation:

1. F510 Start-up and Installation Manual
2. F510 Instruction Manual

Read this instruction manual thoroughly before proceeding with installation, connections (wiring), operation, or maintenance and inspection.

Ensure you have sound knowledge of the inverter and familiarize yourself with all safety information and precautions before proceeding to operate the inverter.

Please pay close attention to the safety precautions indicated by the warning 4 and caution symbol.

| $\wedge$ Warning | Failure to ignore the information indicated by the warning symbol <br> may result in death or serious injury. |
| :--- | :--- |
| $\lfloor$ Caution | Failure to ignore the information indicated by the caution symbol <br> may result in minor or moderate injury and/or substantial property <br> damage. |

## Chapter 1 Safety Precautions

Users are advised to carefully read the safety precautions required in this chapter before installing, testing and repairing the system. Any personnel injury and equipment loss caused by illegal operation are irrelevant to the company and bear any responsibility.

### 1.1 Before Supplying Power to the Inverter

## Warning

> The main circuit must be correctly wired. For single phase supply use input terminals (R/L1, T/L3) and for three phase supply use input terminals (R/L1, S/L2, T/L3). Terminals U/T1, V/T2, W/T3 must only be used to connect the motor. Connecting the input supply to any of the U/T1, V/T2 or W/T3 terminals will cause damage to the inverter.

## Caution

> To avoid the front cover from disengaging or other physical damage, do not carry the inverter by its cover. Support the unit by its heat sink when transporting. Improper handling can damage the inverter or injure personnel, and should be avoided.
$>$ To avoid the risk of fire, do not install the inverter on or near flammable objects. Install on nonflammable objects such as metal surfaces.
> If several inverters are placed inside the same control panel, provide adequate ventilation to maintain the temperature below $40^{\circ} \mathrm{C} / 104^{\circ} \mathrm{F}\left(50^{\circ} \mathrm{C} / 122^{\circ} \mathrm{F}\right.$ without a dust cover) to avoid overheating or fire.
> When removing or installing the digital operator, turn off the power first, and then follow the instructions in this manual to avoid operator error or loss of display caused by faulty connections.

## Warning

> This product is sold subject to IEC 61800-3. In a domestic environment this product may cause radio interference in which case the user may need to apply corrective measures.
$>$ Over temperature protection function on motor is provided, please follow the description of control circuit terminals, and refer to the parameter group 08.

### 1.2 Wiring

## 4 Warning

> Always turn OFF the power supply before attempting inverter installation and wiring of the user terminals.
> Always turn OFF the power supply before attempting inverter installation and wiring of the user terminals.
) Wiring must be performed by a qualified personnel / certified electrician.
> Make sure the inverter is properly grounded. (200V Class: Grounding impedance shall be less than $100 \Omega$. 400V Class: Grounding impedance shall be less than $10 \Omega$.) It is required to disconnect the ground wire in the control board to avoid the sudden surge causing damage on electronic parts if it is improperly grounded.
> Please check and test emergency stop circuits after wiring. (Installer is responsible for the correct wiring.)
> Never touch any of the input or output power lines directly or allow any input or output power lines to come in contact with the inverter case.
> Do not perform a dielectric voltage withstand test (megger) on the inverter or this will result in inverter damage to the semiconductor components.

## Caution

> The line voltage applied must comply with the inverter's specified input voltage.
$>$ Connect braking resistor and braking unit to the designated terminals.
$>$ Do not connect a braking resistor directly to the DC terminals $\mathrm{P}(+)$ and $\mathrm{N}(-)$, otherwise fire
may result.
> Use wire gauge recommendations and torque specifications.
$>$ Never connect input power to the inverter output terminals U/T1, V/T2, W/T3.
$>$ Do not connect a contactor or switch in series with the inverter and the motor.
> Do not connect a power factor correction capacitor or surge suppressor to the inverter output.
$>$ Ensure the interference generated by the inverter and motor does not affect peripheral devices.

### 1.3 Before Operation

## Warning

> Make sure the inverter capacity matches the parameters 13-00 before supplying power.
$>$ Reduce the carrier frequency (parameter 11-01) or install the output filter to reduce the overvoltage or oscillation at the load side and avoid damage to the motor, if the cable from the inverter to the motor is over $80 \mathrm{ft}(25 \mathrm{~m})$. A high-frequency current can be generated by stray capacitance between the cables and result in an overcurrent trip of the inverter, an increase in leakage current, or an inaccurate current readout.
> Be sure to install all covers before turning on power. Do not remove any of the covers while power to the inverter is on, otherwise electric shock may occur.
> Do not operate switches with wet hands, otherwise electric shock may result.
$>$ Do not touch inverter terminals when energized even if inverter has stopped, otherwise electric shock may result.

### 1.4 Parameter Setting

## Caution

$>$ Do not connect a load to the motor while performing an auto-tune.
> Make sure the motor can freely run and there is sufficient space around the motor when performing a rotational auto-tune.

### 1.5 Operation

## Warning

> Be sure to install all covers before turning on power. Do not remove any of the covers while power to the inverter is on, otherwise electric shock may occur.
> Do not connect or disconnect the motor during operation. This will cause the inverter to trip and may cause damage to the inverter.
> Operations may start suddenly if an alarm or fault is reset with a run command active. Confirm that no run command is active upon resetting the alarm or fault, otherwise accidents may occur.
> Do not operate switches with wet hands, otherwise electric shock may result.
> An external emergency stop switch is enabled when parameter 08-30 is set for the run permissive function.
> It provides an independent external hardware emergency switch, which emergently shuts down the inverter output in the case of danger.
> If automatic restart after power recovery (parameter 07-00) is enabled, the inverter will start automatically after power is restored.
> Make sure it is safe to operate the inverter and motor before performing a rotational auto-tune.
$>$ Do not touch inverter terminals when energized even if inverter has stopped, otherwise electric shock may result.
> Do not check signals on circuit boards while the inverter is running.
$>$ After the power is turned off, the cooling fan may continue to run for some time.

## Caution

$>$ Do not touch heat-generating components such as heat sinks and braking resistors.
$>$ Carefully check the performance of motor or machine before operating at high speed, otherwise Injury may result.
$>$ Note the parameter settings related to the braking unit when applicable.
$>$ Do not use the inverter braking function for mechanical holding, otherwise injury may result.
$>$ Do not check signals on circuit boards while the inverter is running.

### 1.6 Maintenance, Inspection and Replacement

## Warning

$>$ Wait a minimum of 5 minutes after power has been turned OFF before starting an inspection. Also confirm that the charge light is OFF and that the DC bus voltage has dropped below 25 Vdc . Wait a minimum of 15 minutes while inverter is over 20HP.
$>$ Never touch high voltage terminals in the inverter.
$>$ Make sure power to the inverter is disconnected before disassembling the inverter.
$>$ Only authorized personnel should perform maintenance, inspection, and replacement operations. (Take off metal jewelry such as watches and rings and use insulated tools.)

## Caution

$>\quad$ The Inverter can be used in an environment with a temperature range from $14^{\circ}-104^{\circ} \mathrm{F}$ $\left(-10-40^{\circ} \mathrm{C}\right)$ and relative humidity of $95 \%$ non-condensing.
$>$ The inverter must be operated in a dust, gas, mist and moisture free environment.

### 1.7 Disposal of the Inverter

## Caution

> Please dispose of this unit with care as an industrial waste and according to your required local regulations.
$>$ The capacitors of inverter main circuit and printed circuit board are considered as hazardous waste and must not be burned.
$>$ The Plastic enclosure and parts of the inverter such as the top cover board will release harmful gases if burned.

Equipment containing electrical components may not be disposed of together with domestic waste. It must be separately collected with electrical and electronic waste according to local and currently valid legislation.

### 1.8 Guaranteed liability exemption

- Loss of opportunity caused by the company's products, damage to customers of your company or your company, damage to non-company products, or compensation for other businesses, whether within the warranty period or not, is not covered by the company.

## Chapter 2 Model Description

### 2.1 Nameplate Data

It is essential to verify the F510 inverter nameplate and make sure that the F510 inverter has the correct rating so it can be used in your application with the proper sized AC motor.

Unpack the F510 inverter and check the following:
(1) The F510 inverter and quick setting guide are contained in the package.
(2) The F510 inverter has not been damaged during transportation there should be no dents or parts missing.
(3) The F510 inverter is the type you ordered. You can check the type and specifications on the main nameplate.
(4) Check that the input voltage range meets the input power requirements.
(5) Ensure that the motor HP matches the motor rating of the inverter.

### 2.2 Model Identification

## Inverter Models - Motor Power Rating :

200V Class

| ```Voltage (Vac) & Frequency (Hz)``` | F510 Model | Motor Power (Hp) | Applied Motor (kW) | Filter |  | Protection Class (IP55) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | with | without |  |
| $\begin{gathered} 3 p h \\ 200 \sim 240 \mathrm{~V} \\ +10 \% /-15 \% \\ 50 / 60 \mathrm{~Hz} \end{gathered}$ | F510-2001- $\square$ | 1 | 0.75 |  | () |  |
|  | F510-2002- $\square$ | 2 | 1.5 |  | ( |  |
|  | F510-2003- $\square$ | 3 | 2.2 |  | ( $)$ |  |
|  | F510-2005- $\square$ | 5 | 3.7 |  | ( |  |
|  | F510-2008- $\square$ | 7.5 | 5.5 |  | ( |  |
|  | F510-2010- $\square$ | 10 | 7.5 |  | () |  |
|  | F510-2015- $\square$ | 15 | 11 |  | () |  |
|  | F510-2020- $\square$ | 20 | 15 |  | ( |  |
|  | F510-2025- $\square$ | 25 | 18.5 |  | () |  |
|  | F510-2030- $\square$ | 30 | 22 |  | ( |  |
|  | F510-2040- $\square$ | 40 | 30 |  | ( |  |
|  | F510-2050- $\square$ | 50 | 37 |  | () |  |
|  | F510-2060- $\square$ | 60 | 45 |  | ( $)$ |  |
|  | F510-2075- $\square$ | 75 | 55 |  | ( |  |
|  | F510-2100- $\square$ | 100 | 75 |  | ( |  |
|  | F510-2125- $\square$ | 125 | 94 |  | ( |  |
|  | F510-2150- $\square$ | 150 | 112 |  | ( |  |
|  | F510-2175- $\square$ | 175 | 130 |  | ( |  |

## 400V Class

## Chapter 3 Environment and Installation

### 3.1 Environment

The environment will directly affect the proper operation and the life span of the inverter. To ensure that the inverter will give maximum service life, please comply with the following environmental conditions:

| Protection |  |
| :---: | :---: |
| Protection | IP20/ IP21/ NEMA 1, IP00 |
| Class | IP55/ NEMA 12 |
| Ambient Environment |  |
| Operating Temperature | IP20/IP21/IP55: $-10^{\circ} \mathrm{C}-+40^{\circ} \mathrm{C}\left(14-104{ }^{\circ} \mathrm{F}\right)$ <br> IP00 (Without Cover): $-10^{\circ} \mathrm{C}-+50^{\circ} \mathrm{C}\left(14-122^{\circ} \mathrm{F}\right)$ <br> Enhanced type frame 5 is $50^{\circ} \mathrm{C}$ without de-rating. <br> The maximum operating temperature is $60^{\circ} \mathbf{C}$, but it is required to derate $2 \%$ of current at each additional $1^{\circ} \mathrm{C}$. <br> If several inverters are placed in the same control panel, provide a heat removal means to maintain ambient temperatures |
| Storage Temperature | $-20^{\circ} \mathrm{C}-+70^{\circ} \mathrm{C}\left(-4-158{ }^{\circ} \mathrm{F}\right)$ |
| Humidity | 95\% non-condensing Relative humidity $5 \%$ to $95 \%$, free of moisture. (Follow IEC60068-2-78 standard) |
| Altitude | Altitude: Below 1000 m ( 3281 ft ) <br> It is required to derate $1 \%$ of current at each additional 100 m . The maximum altitude is $\mathbf{3 0 0 0} \mathbf{~ m}$. |
| Installation Site | Avoid direct sunlight. |
|  | Avoid exposure to rain or moisture. |
|  | Avoid oil mist and salinity. |
|  | Avoid corrosive liquid and gas. |
|  | Avoid dust, lint fibers, and small metal filings. |
|  | Avoid electromagnetic interference (soldering machines, power machines). |
|  | Keep away from radioactive and flammable materials. |
|  | Avoid vibration (stamping, punching machines etc.). Add a vibration-proof pad if the situation cannot be avoided. |
| Shock | Maximum acceleration: $1.2 \mathrm{G}\left(12 \mathrm{~m} / \mathrm{s}^{2}\right)$, from 49.84 to 150 Hz Displacement amplitude : 0.3 mm (peak value), from 10 to 49.84 Hz (Follow IEC60068-2-6 standard) |

### 3.2 Installation

### 3.2.1 Installation Spaces

■ When installing the inverter, ensure that inverter is installed in upright position (vertical direction) and there is adequate space around the unit to allow normal heat dissipation as per the following Fig. 3.2.1

Fig 3.2.1: F510 Installation space
$X=1.18$ " $(30 \mathrm{~mm})$ for inverter ratings up to 18.5 kW
$X=1.96$ " $(50 \mathrm{~mm})$ for inverter ratings 22 kW or higher

- Important Note: The inverter heatsink temperature can reach up to $90^{\circ} \mathrm{C} / 194^{\circ} \mathrm{F}$ during operation; make sure to use insulation material rated for this temperature.

### 3.2.2 External View

### 3.2.2.1 External View (IP00/ IP20)

(a) 200V 1-7.5HP/ 400V 1-10HP

(Wall-mounted type, IEC IP00)

(Wall-mounted type, IEC IP20, NEMA1)
(b) $200 \mathrm{~V} \mathbf{1 0 - 3 0 H P} 400 \mathrm{~V} 15-40 \mathrm{HP}$

(Wall-mounted type, IEC IP00)

(Wall-mounted type, IEC IP20, NEMA1)
(c) $200 \mathrm{~V} 40-50 \mathrm{HP}$ / $400 \mathrm{~V} 50-75 \mathrm{HP}$

(Wall-mounted type, IEC IP20, NEMA1)
(d) $200 \mathrm{~V} \mathbf{6 0 - 1 2 5 H P /} 400 \mathrm{~V} 100-250 \mathrm{HP}$

(Wall-mounted type, IEC IP55)
(b) $400 \mathrm{~V} \mathbf{3 0 - 1 0 0 H P}$

(Wall-mounted type, IEC IP55)

### 3.2.3 Warning Labels

## Important:

Warning information located on the front cover must be read upon installation of the inverter.

## WARNING

Risk of electrical shock. Shut off main power and wait for 5 minutes before servicing.

Hot surface. Risk of burn.
CAUTION
See manual before operation.
(a) 200V: 1-7.5HP/ 400V: 1-10HP (IP20)

## WARNING

Risk of electrical shock. Shut off main power and wait for 5 minutes before servicing.
CAUTION
See manual before operation.
(b) 200V: 10-15HP/ 400V: 15-20HP (IP20)

## WARNING

Risk of electrical shock. Shut off main power and wait for 15 minutes before servicing.
CAUTION
See manual before operation.
(c) 200V: $\mathbf{2 0 - 1 7 5 H P / ~ 4 0 0 V : ~ 2 5 - 8 0 0 H P ( I P 2 0 ) ~}$

## WARNING

Risk of electrical shock. Shut off main power and wait for 5 minutes before servicing.
CAUTION
See manual before operation.
(d) 400V : 1-100HP (IP55)

### 3.2.4 Removing the Front Cover and Keypad

- Before making any wiring connections to the inverter, the front cover needs to be removed.

## IP00/ IP20 Type

## Caution

- It is not required to remove the digital operator before making any wiring connections.
- Models 200V, 1-30 HP and 400V, $1-40$ HP have a plastic cover. Loosen the screws and remove the cover to gain access to the terminals and make wiring connections. Place the plastic cover back and fasten screws when wiring connections have been made.
- Models 200V, 40-175HP and 400V, 50-800HP have a metal cover. Loosen the screws and remove the cover to gain access to the terminals and make wiring connections. Place the metal cover back and fasten screws when wiring connections have been made.

## IP55 Type

- It is essential to remove the digital operator before making any wiring connections.
- Model 400V, 1-25 HP has a plastic cover. Loosen the screws and remove the cover to gain access to the terminals and make wiring connections. Place the plastic cover back and fasten screws when wiring connections have been made, suggested screw locking torque is $8 \mathrm{kgf}-\mathrm{cm}$.
- Models 400V, 30-100HP has a metal cover. Loosen the screws and remove the cover to gain access to the terminals and make wiring connections. Place the metal cover back and fasten screws when wiring connections have been made, suggested screw locking torque is $8 \mathrm{kgf-cm}$.

### 3.2.4.1 IP00/ IP20 Type

(a) $200 \mathrm{~V} 1-3 \mathrm{HP} / 400 \mathrm{~V} 1-3 \mathrm{HP}$

Step 1: Unscrew

Step 2: Remove whole top cover, and unlock RJ45 connector

Step 3: Make wire connections, lock RJ45 connector and place top cover back

Step 4: Fasten screw
(b) 200V 5-7.5HP(Standard Type) 5~10HP (Enhanced Type) I400V 5-10HP

Step 1: Unscrew

Step 3: Make wire connections and place cover back

Step 2: Remove cover

Step 4: Fasten screw
(c) 200 V 10-30HP/ 400V 15-40HP

Step 1: Unscrew

Step 2: Remove cover

Step 3: Make wire connections and place cover back

Step 4: Fasten screw
(d) 200V 40-50HP/ 400V 50-75HP (Standard Type) 50~100HP (Enhanced Type)

Step 1: Unscrew cover

Step 3: Make wire connections and place cover back

Step 2: Remove cover

Step 4: Fasten screw

Step 1: Unscrew cover

Step 3: Make wire connections and place cover back

Step 2: Remove cover

Step 4: Fasten screw

Step 1: Unscrew cover

Step 2: Remove cover

Step 3: Make wire connections and place cover back

Step 4: Fasten screw
(g) 400 V 535-800HP

Step 1: Unscrew cover

Step 3: Make wire connections and place cover back

Step 2: Remove cover

Step 4: Fasten screw

### 3.2.4.2 Built-in Filter Type (IP20/ IP00)

(a) $400 \mathrm{~V} 1-3 \mathrm{HP}$

Step 1: Unscrew cover

Step 3: Unlock RJ45 connector, Unscrew filter section

Step 5: Make wire connections, lock RJ45 connector and place top cover back

Step 2: Remove whole top cover

Step 4: Remove filter cover

Step 6: Fasten screw
(b) $400 \mathrm{~V} 5-75 \mathrm{HP}$

Step 1: Unscrew cover

Step 3: Unscrew filter section

Step 5: Make connections and place filter cover back

Step 2: Remove cover

Step 4: Remove filter cover

Step 6: Fasten screw

### 3.2.4.3 Water proof Type (IP55)

(a) $400 \mathrm{~V} 1-25 \mathrm{HP}$

Step 1: Unscrew operator

Step 2: Remove operator

Step 3: Pull out operator and remove power line

Step 4: Unscrew cover

Step 5: Check the inside waterproof gasket is not pulled away from cover while opening the cover
(b) $400 \mathrm{~V} \mathbf{3 0 - 1 0 0 H P}$

Step 1: Unscrew operator

Step 2: Remove operator

Step 3: Pull out operator and unlock RJ45 connector

Step4: Unscrew cover and remove it

### 3.3 Inverter Wiring

### 3.3.1 Wire Gauges and Tightening Torque

To comply with UL standards, use UL approved copper wires (rated $75^{\circ} \mathrm{C}$ ) and round crimp terminals (UL Listed products) as shown in table below when connecting to the main circuit terminals. Teco recommends using crimp terminals manufactured by NICHIFU Terminal Industry Co., Ltd and the terminal crimping tool recommended by the manufacturer for crimping terminals and the insulating sleeve.

Table 3.3.1.1 Wire gauges and tightening torque terminal screw size

| $\begin{gathered} \text { Wire size } \\ \text { mm² (AWG) } \end{gathered}$ | Terminal Screw size | Model of round crimp terminal | Tightening torque kgf.cm (in.lbs) | Model of insulating sleeve | Model of crimp tool |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0.75 (18) | M3.5 | R1.25-3.5 | 8.2 to 10 (7.1 to 8.7) | TIC 1.25 | NH 1 |

## - Main Circuit Terminal Wiring

UL approval requires crimp terminals when wiring the drive's main circuit terminals. Use crimping tools as specified by the crimp terminal manufacturer. Teco recommends crimp terminals made by NICHIFU for the insulation cap.

The table below matches drives models with crimp terminals and insulation caps.

Closed-Loop Crimp Terminal Size

| Drive Model F510 | Wire Gauge mm ${ }^{2}$, (AWG) |  |  |  |  |  | Terminal | Crimp Terminal | Tool | Insulation Cap |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | R/L1 | S/L2 | T/L3 | U/T1 | V/T2 | W/T3 | Screws | Model No. | Machine No. | Model No. |
| $\begin{gathered} 2001 / 2002 / \\ 2003 \end{gathered}$ | 2 (14) |  |  |  |  |  | M4 | R2-4 |  | TIC 2 |

### 3.3.2 Wiring Peripheral Power Devices

## Caution

- After power is shut off to the inverter, the capacitors will slowly discharge. Do NOT touch the inverter circuitry or replace any components until the "CHARGE" indicator is off.
- Do NOT wire or connect/disconnect internal connectors of the inverter when the inverter is powered up or when powered off and the "CHARGE"" indicator is on.
- Do NOT connect inverter output $\mathrm{U}, \mathrm{V}$ and W to the supply power. This will result in damage to the inverter.
- The inverter must be by properly grounded. Use terminal $E$ to connect earth ground and comply with local standards.
- It is required to disconnect the grounded wire in the control board when the inverter is not grounded or floating ground power system.

Do NOT perform a dielectric voltage withstand test (megger) on the inverter this will result in inverter damage to the semiconductor components.

Do NOT touch any of the components on the inverter control board to prevent damage to the inverter by static electricity.

## Caution

- Refer to the recommended wire size table for the appropriate wire to use. The voltage between the power supply and the input of the inverter may not exceed $2 \%$.

Phase-to-phase voltage drop $(V)=\sqrt{3} \times$ resistance of wire $(\Omega / k m) \times$ length of line $m) \times$ current $\times 10^{-3}$. ( $k m=3280 \times$ feet $) /(m=3.28 \times$ feet $)$

- Reduce the carrier frequency (parameter 11-01) If the cable from the inverter to the motor is greater than 25 m ( 82 ft ). A high-frequency current can be generated by stray capacitance between the cables and result in an overcurrent trip of the inverter, an increase in leakage current, or an inaccurate current readout.
- To protect peripheral equipment, install fast acting fuses on the input side of the inverter. Refer to section 11.4 for additional information.

### 3.3.3 General Wiring Diagram

### 3.3.3.1 General Wiring Diagram (For Standard H \& C type)

The following is the standard wiring diagram for the F510 inverter (©) indicates main circuit terminals and $\bigcirc$ indicates control circuit terminals). Locations and symbols of the wiring terminal block might be different due to different models of F510. The description of control circuit terminals and main circuit terminals can be referred to Table 3.3.5.1, 3.3.6.1 and 3.3.6.2

### 3.3.3.2 General Wiring Diagram (For Enhanced E \& G type)

The following is the standard wiring diagram for the F510 inverter ( $\bigcirc$ indicates main circuit terminals and $\bigcirc$ indicates control circuit terminals). Locations and symbols of the wiring terminal block might be different due to different models of F510. The description of control circuit terminals and main circuit terminals can be referred to Table 3.3.5.1, 3.3.6.1 and 3.3.6.2

Remarks:
*1: Models IP20 200V 1~30HP, 400V 1~40HP have a built-in braking transistor so that the braking resistor can be connected between terminal B1 and B2.
*2: The multi-function digital input terminals S1~S6 can be set to Source (PNP) or Sink (NPN) mode via SW6.
*3: Use SW3/SW4 to switch between voltage (0~10V) and current (4~20mA) input for Multi-function analog input 2 (AI2). Besides please also check parameter 04-00 for proper setting.
*4: Run permissive input SF1 \& SF2 is a normally closed input. This input should be closed to enable the inverter output. To activate this input, open the link between SF1/ SF2 and SG.
*5: When using the open collector for pulse input, it doesn't need resistance because of built-in pull-up resistance.
*6: AO1 / AO2 default setting is $0 \sim+10 \mathrm{~V}$.
*7: It need turn on the switch for the terminal resistor RS485 in the last inverter when many inverters in parallel connection.
*8: Only the model 200V 5~50HP and 400V 5~100HP provide P1 terminal, for external DCL connected between P1 and P2, P1 and P2 are short-circuited before shipping out from the factory
*9: Both 200 V class $60 \mathrm{HP} \sim 175 \mathrm{HP}$ and 400 V class $125 \mathrm{HP} \sim 425 \mathrm{HP}$ have built-in DC reactors.

### 3.3.4 Single/ Multi- Pump Dedicated Wiring Diagram

### 3.3.4.1 Single/ Multi- Pump Dedicated Wiring Diagram (For Standard H \& C type)

## PUMP Wiring Diagram for Pressure Sensor of Voltage Type Single Pump:

Multi-Pump:

## PUMP Wiring Diagram for Pressure Sensor of Current Type

## Single Pump:

Multi-Pump:

Notes: 1. The position of dip switch requires being correct (SW2, SW3).
2. It is required to reconnect after setting Master/ Slave.
3. 24 VG and GND require short circuit.
4. When the communication modes is selected to be multiple pumps in parallel connection (0901=3), the baud rate settings (09-02) of Master and Slave are required to be consistent. Refer to parameter 23-31 for the actions in parallel connection modes.
5. In the wiring of multi-pump current type pressure sensor, it is required to adjust Slave to be 04-07(Al2 Gain) $\mathbf{= 2 5 2 . 0 \%}$ and 04-08(Al1 Bias) $\mathbf{= 2 5 . 0 \%}$.
6. In multi-pump operation, if one of the inverter does not Power ON, the 24 V of connection is also need to dis-connect to avoid magnetoresistance effect.

Note: For $400 \mathrm{~V} 535 \sim 800 \mathrm{HP}$, the terminal separate to two, to share the current.

## - Input / Output Power Section Block Diagram

The following diagrams show the basic configuration of the power sections for the range of horsepower and input voltages. This is shown for reference only and is not a detailed depiction. (For Enhanced E \& G type frame 2~5, which can connect option DC reactor, please refer to General Wiring Diagram)

- IP00/IP20 Type

- IP55 Type

1. IP55 400V: 1~15HP

2. IP55 400V: 20~25HP

3. IP55 400V: 30~100HP

## - Cooling Fan Supply Voltage Selection (400V class)

The inverter input voltage range of the F510 400V class models ranges from 380 to 460Vac. In these models the cooling fan is directly powered from the power supply. Inverter models F510-4150/ 4175/ 4215/ 4250/4300/4375/4425/4535/4670/4800-H3 requires the user to select the correct jumper position based on the inverter input voltage ("400V" is the default position for these models). Please select the correct position according to the input voltage. If the voltage setting is too low, the cooling fan will not provide adequate cooling for the inverter resulting in an over-heat error. If the input voltage is greater than 460 Vac , select the " 460 V " position.
(1) $400 \mathrm{~V}: 150 \mathrm{HP} \sim 250 \mathrm{HP}$

(2) $400 \mathrm{~V}: 300 \mathrm{HP} \sim 800 \mathrm{HP}$

## - Power Input Wire Size, NFB and MCB Part Numbers

The following table shows the recommended wire size, molded case circuit breakers and magnetic contactors for each of the F510 models. It depends on the application whether or not to install a circuit breaker. The NFB must be installed between the input power supply and the inverter input (R/L1, S/L2, T/L3).
Note: When using a ground protection, make sure the current setting is above 200 mA and trip delay time is 0.1 sec of higher.

Table 3.3.6.3 Wiring Instrument for 200V/400V class (IP00/IP20 type)

| F510 Model |  |  |  | Wire size AWG (mm ${ }^{2}$ ) |  |  | NFB ${ }^{*}$ | MC* ${ }^{\text {3 }}$ |

*1. The main circuit terminals: R/L1, S/L2, T/L3, U/T1, V/T2, W/T3, B1 / P, B2, $\ominus, ~ \oplus$.
*2. Control line is the terminal wire on the control board.
*3. The NFB and MCB listed in the table are of TECO product numbers, products with same rated specification of other brands may be used. To reduce electrical noise interference, ensure that a RC surge absorber (R: $10 \Omega / 5 \mathrm{~W}, \mathrm{C}: 0.1 \mu \mathrm{f} / 1000 \mathrm{VDC}$ ) is added to both sides of MCB coil.

*1. The main circuit terminals: $R(L 1), S(L 2), T(L 3), \ominus, \oplus 1, \oplus 2, U(T 1), V(T 2), W(T 3), B 1, B 2$ (Polyethylene power line of 600 V is recommended to be used.)
*2. Control line is the terminal wire on the control board.
*3. The NFB and MCB listed in the table are of TECO product numbers, products with same rated specification of other brands may be used. To reduce electrical noise interference, ensure that a RC surge absorber ( R : $10 \Omega / 5 \mathrm{~W}, \mathrm{C}: 0.1 \mu \mathrm{f} / 1000 \mathrm{VDC})$ is added to both sides of MCB coil.

### 3.3.7 Wiring Precautions

(!) Danger

- Do NOT remove any protective covers or attempt any wiring while input power is applied. Connect all wiring before applying input power. When making wiring changes after power up, remove input power and wait a minimum of five minutes after power has been turned off before starting. Also confirm that the charge lamp is off and that DC voltage between terminals B1/P or (+) and (-) does not exceed 25 V , otherwise electric shock may result.
- Only authorized personnel should work on the equipment. (Take off metal jewelry such as watches and rings and use insulated tools.), otherwise electric shock or injury may result.

## (A) Wiring for control circuit:

(1) Separate the wiring for control circuit terminals from main circuit wiring for terminals (R/L1, S/L2, T/L3, U/T1, V/T2, and W/T3).
(2) Separate the wiring for control circuit terminals (R1A, R1B, R1C / R2A, R2C /R3A, R3C) from wiring for terminals $\mathrm{S} 1 \sim \mathrm{~S} 6, \mathrm{~A} 01, \mathrm{~A} 02, \mathrm{GND},+10 \mathrm{~V}-$, $\mathrm{Al} 1, \mathrm{Al} 2$, and GND wiring.
(3) Use shielded twisted-pair cables (\#24-\#14 AWG / 0.5-2 mm²) shown in Fig. 3.3.7.1 for control circuits to minimize noise problems. The maximum wiring distance should not exceed 50 m ( 165 ft ).

Figure 3.3.7.1 Shielded Twisted-Pair
(B) Wiring for main circuit:
(1) The Input power supply voltage can be connected in any phase sequence to power input terminals R/L1, S/L2, or T/L3 on the terminal block.
(2) DO NOT connect the AC input power source to the output terminals U/T1, V/T2 and. W/T3.
(3) Connect the output terminals U/T1, V/T2, W/T3 to motor lead wires U/T1, V/T2, and W/T3, respectively.
(4) Check that the motor rotates forward with the forward run source. If it does not, swap any 2 of the output cables to change motor direction.
(5) DO NOT connect phase correcting capacitors or LC/RC noise filter to the output circuit.

## (C) Grounding:

(1) Connect the ground terminal (E) to ground having a resistance of less than $100 \Omega$.
(2) Do not share the ground wire with other devices, such as welding machines or power tools.
(3) Always use a ground wire that complies with the local codes and standards for electrical equipment and minimize the length of ground wire.
(4) When using more than one inverter, be careful not to loop the ground wire, as shown below in Fig. 3.3.7.2.

Figure 3.3.7.2 F510 Inverter Grounding

### 3.3.8 Input Power and Cable Length

## - Cable size

The length of the cables between the input power source and /or the motor and inverter can cause a significant phase to phase voltage reduction due to the voltage drop across the cables. The wire size shown in Tables 3.3.6.3 \& 3.3.6.4 is based on a maximum voltage drop of $2 \%$. If this value is exceeded, a wire size having larger diameter may be needed. To calculate phase tot phase voltage drop, apply the following formula:

Phase-to-phase voltage drop $(V)=\sqrt{3} \times$ resistance of wire $(\Omega / k m) \times$ length of line $m) \times$ current $\times 10^{-3}$.

```
(km=3280 x feet)
```

```
(m=3.28 x feet)
```

## - Cable length vs. Carrier frequency

The allowable setting of the PWM carrier frequency is also determined by motor cable length and is specified in the following Table 3.3.8.1.

Table 3.3.8.1 Cable Length vs. Carrier Frequency

| Cable length between <br> the inverter and <br> Motor in m (ft.). | $<30$ | $30-50$ | $50-100$ | $\geq 100$ |
| :---: | :---: | :---: | :---: | :---: |
| $(100)$ | $(100-165)$ | $(166-328)$ | $(329)$ |  |
| Recommended carrier <br> frequency allowed <br> Parameter 11-01 | 16 kHz <br> $(\max )$ | 10 kHz <br> $(\max )$ | 5 kHz <br> $(\max )$ | 2 kHz <br> $(\mathrm{max})$ |

## - Installing an AC line reactor

If the inverter is connected to a large-capacity power source ( 600 kVA or more), install an optional AC reactor on the input side of the inverter. This also improves the power factor on the power supply side.

### 3.4 Inverter Specifications

## Basic Specifications

(a) 200 V class

|  | Inverter capacity (HP) | 1 | 2 | 3 | 5 | 7.5 | 10 | 15 | 20 | 25 | 30 | 40 | 50 | 60 | 75 | 100 | 125 | 150 | 175 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Rated Output Capacity (KVA) | 1.9 | 2.9 | 4.0 | 5.5 | 8 | 11.4 | 15.2 | 21.3 | 26.2 | 30 | 41.9 | 52.5 | 64.3 | 76.2 | 95.2 | 118.8 | 152.4 | 171.4 |
|  | Rated Output Current (A) | 5.0 | 7.5 | 10.6 | 14.5 | 22 | 30 | 42 | 56 | 69 | 80 | 110 | 138 | 169 | 200 | 250 | 312 | 400 | 450 |
|  | Maximum Applicable Motor ${ }^{* 1} \mathrm{HP}$ (KW) | $\begin{gathered} 1 \\ (0.75) \end{gathered}$ | $\begin{gathered} 2 \\ (1.5) \end{gathered}$ | $\begin{array}{\|c} 3 \\ (2.2) \end{array}$ | $\begin{gathered} 5 \\ (3.7) \end{gathered}$ | $\begin{gathered} \hline 7.5 \\ (5.5) \\ \hline \end{gathered}$ | $\begin{array}{\|c\|} \hline 10 \\ (7.5) \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline 15 \\ (11) \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline 20 \\ (15) \\ \hline \end{array}$ | $\begin{gathered} 25 \\ (18.5) \end{gathered}$ | $\begin{array}{\|c} \hline 30 \\ (22) \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline 40 \\ \hline(30) \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline 50 \\ (37) \end{array}$ | $\begin{array}{\|c\|} \hline 60 \\ (45) \\ \hline \end{array}$ | $\begin{gathered} \hline 75 \\ (55) \end{gathered}$ | $\begin{array}{\|l\|} \hline 100 \\ (75) \end{array}$ | $\begin{aligned} & 125 \\ & (90) \end{aligned}$ | $\begin{gathered} \hline 150 \\ (110) \end{gathered}$ | $\begin{array}{c\|} \hline 175 \\ (130) \end{array}$ |

|  | Rated Voltage, Frequency | 3 -phase $380 \mathrm{~V} \sim 480 \mathrm{~V}, 50 / 60 \mathrm{~Hz}$ |  |  |  |
|  | Allowable Voltage Fluctuation | -15\% ~ +10\% |  |  |  |
|  | Allowable Frequency Fluctuation | $\pm 5 \%$ |  |  |  |

*1: Take standard 4-pole induction motor as the base.
*2: F510 model is designed to be used in normal duty (ND), whose overload capability is $120 \%$ for 1 min.
*3: If it is greater than default carrier frequency, you need to adjust the load current based on the de-rating curve.

| 200V class | Carrier freq. <br> default setting | Carrier freq. <br> range | 400V class | Carrier freq. <br> default setting | Carrier freq. <br> range |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $1 \sim 25 \mathrm{HP}$ | 2 KHz | $2 \sim 16 \mathrm{KHz}$ | $1 \sim 30 \mathrm{HP}$ | 4 KHz | $2 \sim 16 \mathrm{KHz}$ |
| 30 HP | 2 KHz | $2 \sim 12 \mathrm{KHz}$ | 40 HP | 2 KHz | $2 \sim 16 \mathrm{KHz}$ |

| - | - | - | $535 \sim 800 \mathrm{HP}$ | 4 KHz | $2 \sim 5 \mathrm{KHz}$ |

*4: If control mode is set to SLV mode and maximum frequency (01-02) is larger than 80 Hz , the carrier frequency range is $2 \sim 8 \mathrm{~Hz}$.

The following table shows the maximum output frequency for each control mode.

| Control <br> mode | Other settings | Maximum <br> output <br> frequency |
| :---: | :--- | :---: |
| V/F | Unlimited | 599 Hz |
|  | 200 V 1~15HP, 400V 1~20HP | 150 Hz |
|  | $200 \mathrm{~V} 20 \sim 30 \mathrm{HP}, 400 \mathrm{~V} 25 \mathrm{HP}$ | 110 Hz |
|  | $400 \mathrm{~V} 30 \sim 40 \mathrm{HP}$ | 100 Hz |
|  | $200 \mathrm{~V} 40 \sim 125 \mathrm{HP}, 400 \mathrm{~V} 50 \sim 215 \mathrm{HP}$, <br> carrier (11-01) is set as 8K or below 8 K. | 100 Hz |
|  | $200 \mathrm{~V} 40 \sim 125 \mathrm{HP}, 400 \mathrm{~V} 50 \sim 215 \mathrm{HP}$, <br> carrier (11-01) is set as above 8K. | 80 Hz |
|  | 200 V 150~175HP, 400V 250~800HP | 100 Hz |
| PMSLV | Unlimited | 599 Hz |

## General Specifications

|  | Operation Modes | LED keypad with seven-segment display *5 and LCD keypad (Optional HOA LCD keypad); all LCD keypad with parameter copy function |
| :---: | :---: | :---: |
|  | Control Modes | V/F, SLV, PMSLV with space vector PWM mode |
|  | Frequency Control Range | $0.1 \mathrm{~Hz} \sim 599.0 \mathrm{~Hz}$ |
|  | Output Frequency Accuracy (Temperature change) | Digital references: $\pm 0.01 \%$ (-10 to $\left.+40^{\circ} \mathrm{C}\right)$, Analog references: $\pm 0.1 \%\left(25^{\circ} \mathrm{C} \pm 10^{\circ} \mathrm{C}\right)$ |
|  | Speed Control Accuracy | $\pm 0.5 \%$ (Sensorless Vector Control Mode) ${ }^{11}$ |
|  | Frequency Setting Resolution | Digital references: 0.01 Hz , Analog references: $0.06 \mathrm{~Hz} / 60 \mathrm{~Hz}$ |
|  | Output Frequency Resolution | 0.01 Hz |
|  | Inverter Overload | 120\%/1 min |
|  | Frequency Setting Signal | DC 0~+10V / 0~20mA or 4~20mA |
|  | Acceleration/ Deceleration Time | $0.0 \sim 6000.0$ seconds ( separately set acceleration and deceleration time ) |
|  | Voltage, Frequency Characteristics | Custom V/F curve based on parameters |
|  | Braking Torque | About 20\% |
|  | Main Control Functions | Auto tuning, Soft-PWM, Over voltage protection, Dynamic braking, Speed search, Restart upon momentary power loss, 2 sets of PID control, Slip Compensation, RS-485 communication standard, Simple PLC function, 2 sets of analog outputs, Safety switch |
|  | Other Functions | Accumulated power-on/ run time, 30 sets of fault history records and latest fault record state, Energy-saving function setting, Phase loss protection, Smart braking, DC braking, Dwell, S curve acceleration and deceleration, Up/Down operation, Modbus, BACnet MS/TP and Metasys N2 communication protocol, Display of multi-engineering unit, Local/ Remote switch, SINK/SOURCE input interface selection, User parameter settings |
|  | Stall Prevention | Current level can be setting (It can be set separately in acceleration or constant speed; it can be set with or without protection in deceleration) |
|  | Instantaneous Over Current (OC) and Output ShortCircuit (SC) Protection | Inverter stops when the output current exceeds 160\% of the inverter rated current |
|  | Inverter Overload Protection (OL2) | If inverter rated current $120 \% / 1 \mathrm{~min}$ is exceeded, inverter stops. The factory default carrier frequency is $2 \sim 4 \mathrm{KHZ}{ }^{*}$ |
|  | Motor Overload Protection (OL1) | Electrical overload protection curve |
|  | Over voltage (OV) Protection | If the main circuit DC voltage rises over 410 V ( 200 V class)/ 820 V ( 400 V class), the motor stops running. |
|  | Under voltage (UV) Protection | If the main circuit DC voltage falls below 190 V ( 200 V class) /380V ( 400 V class), the motor stops running. |
|  | Auto-Restart after Momentary Power Loss | Power loss exceeds 15 ms . <br> Auto-restart function available after momentary power loss in 2 sec ; 3HP below for 1 sec |
|  | Overheat(OH) Protection | Use temperature sensor for protection. |
|  | Ground Fault (GF) Protection | Use current sensor for protection. |
|  | DC Bus Charge Indicator | When main circuit DC voltage 50V, the CHARGE LED turns on. |
|  | Input Phase Loss (IPL) Protection | If the IPL is detected, the motor stops automatically. |
|  | Output Phase Loss (OPL) Protection | If the OPL is detected, the motor stops automatically. |
|  | Short-circuit current rating (SCCR) | Per UL 508C, the drive is suitable for use on a circuit capable of delivering not more than 100KA symmetrical amperes (rms) when protected by fuses given in the fuse table. |
| Environment Specifications | Installation Location | Indoor (protected from corrosive gases and dust) |
|  | Ambient Temperature | $-10 \sim+40^{\circ} \mathrm{C}\left(14^{\circ} \mathrm{F} \sim 104^{\circ} \mathrm{F}\right)$ (IP20/NEMA1 or IP55/NEMA12), $-10 \sim+50^{\circ} \mathrm{C}\left(14^{\circ} \mathrm{F} \sim 122^{\circ} \mathrm{F}\right)$ (IP00 or top anti-dust cover removed) without de-rating; with de-rating, its maximum operation temperature is $60^{\circ} \mathrm{C}\left(140^{\circ} \mathrm{F}\right)$. (Enhanced type frame 5 is $50^{\circ} \mathrm{C}$ without de-rating |
|  | Storage Temperature | $-20 \sim+70^{\circ} \mathrm{C}\left(-4^{\circ} \mathrm{F} \sim+158^{\circ} \mathrm{F}\right)$ |
|  | Humidity | 95\%RH or less (no condensation) |
|  | Altitude | Altitude: Below 1000 m ( 3281 ft .), It is required to derate $1 \%$ of current at each additional 100 m , the maximum altitude is 3000 m . |
|  | Vibration | $9.8 \mathrm{~m} / \mathrm{s}^{2}(1.0 \mathrm{G})$, meet IEC 60068-2-6 |
|  | Pollution Degree | IP00/IP20/IP21 meet IEC 60721-3-3 Class 3C2, IP55 meet IEC 60721-3-3 Class 3C3 |

| Communication Function |  | Built-in RS-485 as standard (Modbus protocol with RJ45/ BACnet/ Metasys N2) |
| :--- | :--- | :--- |
| PLC Function | Built-in |  |
| EMI Protection |  | The built-in noise filter complies with EN61800-3 available for inverters 400V 75HP or below (IP20) / 400V 60HP or <br> below (IP55) |
| EMS Protection | in compliance with EN61800-3 |  |
| Safety <br> Certification | CE Declaration | in compliance with EN61800-3 (CE \& RE) and EN61800-5-1 (LVD, Low-Voltage Directive) |
|  | UL Certification | UL508C |
| Accessories | Please refer to chapter 11 |  |

[^0]
### 3.5 Inverter De-rating Based on Carrier Frequency

Note: De-rating curve current of carrier frequency means inverter rated current.
(a) 200V Models

Rated Current
Ratio

Rated Current
Ratio

(b) 400V Models

### 3.6 Inverter De-rating Based on Temperature

Note: User needs to adjust the inverter rated current depending on ambient temperature to ensure the appropriate industrial application

## Notes for using the PM motor

1. The inverter carry frequency $(11-01)$ need to set upper than 6 KHz .
2. The rating current of the inverter at 6 KHz carry frequency (11-01) (need refer to the de-rating curve) must be bigger than the PM motor rating current.

## - Capacitor reforming Guide after long storage

For correct performance of this product after long storage before use it is important that Inverter Capacitors are reformed according to the guide below:

| Storage <br> time | Procedure to re-apply voltage |
| :---: | :--- |
| $\leqq 1$ year | Apply rated voltage(*1) of inverter in the normal way |
| Between <br> $1-2$ years | Apply 100\% rated voltage of inverter to the product for one hour |
|  | Use a variable AC power supply to <br> 1. Connecting 25\% of inverter rated voltage for 30 minutes. |
| 2 years | 2. Connecting 50\% of inverter rated voltage for 30 minutes. <br> 3. Connecting 75\% of inverter rated voltage for 30 minutes. <br> 4. Connecting 100\% of inverter rated voltage for 210 minutes. <br> Once the procedures completed, inverter just can be used normally. |

[^1]
### 3.7 Inverter Dimensions

### 3.7.1 Standard Type (IP00/IP20)

(a) 200V: 1-7.5HP(Standard H \& C type) 1-10HP (Enhanced E \& G type)/ 400V: 1-10HP

| Inverter Model | Dimensions in mm (inch) |  |  |  |  |  |  | NW in kg(lbs) |

## Chapter 4 Keypad and Programming Functions

### 4.1 LED Keypad

### 4.1.1 Keypad Display and Keys

| DISPLAY | Description |
| :---: | :--- |
| 5 Digit LED Display | Monitor inverter signals, view / edit parameters, fault / alarm display. |
| LED INDICATORS |  |
| FAULT | LED ON when a fault or alarm is active. |
| FWD | LED ON when inverter is running in forward direction, flashing when stopping. |
| REV | LED On when inverter is running in reverse direction, flashing when stopping. |
| SEQ | LED ON when RUN command is from the external control terminals or from <br> serial communication. |
| REF | LED ON when Frequency Reference command is from the external control <br> terminals or from serial communication. |

| KEYS (8) | Description |
| :---: | :--- |
| RUN | RUN inverter |
| STOP | STOP inverter |
| $\boldsymbol{\nabla}$ | Parameter navigation Up, Increase parameter or reference value |
| LOC/REM | Parameter navigation down, decrease parameter or reference value |
| DSP/FUN | Used to switch between Local Mode and Remote Mode <br> REMOTE Mode: Set by parameters, controlled by control circuit terminals, <br> communication or other ways. <br> LOCAL Mode: Controlled by operator. <br> It displays REMOTE Mode at power-up. Users can switch between LOCAL <br> and REMOTE Mode if they press LOC/ REM keys when the inverter stops. <br> Parameter of 23-41 can determine if LOC/REM keys are enabled or not. |
| $\boldsymbol{4} /$ RESET | Used to scroll to next screen <br> Frequency screen $\rightarrow$ Function selection $\rightarrow$ Monitor parameter |
| READ / ENTER | Selects active seven segment digit for editing with the $\boldsymbol{\Delta} \boldsymbol{\nabla}$ keys <br> Used to reset fault condition. |
| Used to read and save the value of the active parameter. |  |

## Auto-Repeat Keys

Holding the $\triangle$ UP or $V$ DOWN key for a longer period of time will initiate the auto-repeat function resulting in the value of the selected digit to automatically increase or decrease.

### 4.1.2 Seven Segment Display Description

| Actual | LED Display | Actual | LED Display | Actual | LED Display | Actual | LED Display |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | $\begin{aligned} & 17 \\ & 11 \end{aligned}$ | A | $17$ | L | $1$ | Y | $1$ |
| 1 | 1 | B | $1$ | $n$ | 11 | - | - |
| 2 | $5$ | C | $\begin{aligned} & \overline{1} \\ & \mathbf{L} \end{aligned}$ | 0 | $\begin{aligned} & 17 \\ & 11 \end{aligned}$ | - | 11 |
| 3 | $1$ | D | $11$ | P |  |  | - |
| 4 | $1$ | E | $E$ | 9 | $18$ | . | - |
| 5 | $\frac{1}{2}$ | F | $15$ | r | $1{ }^{-}$ |  |  |
| 6 | E | G | $\begin{aligned} & 1 \\ & 10 \end{aligned}$ | S | $1$ |  |  |
| 7 | $7$ | H | $18$ | t | $E$ |  |  |
| 8 |  | , | $1$ | $u$ | 11 |  |  |
| 9 | $18$ | J | $1$ | V | $\begin{aligned} & 11 \\ & 18 \end{aligned}$ |  |  |

Display output frequency

| LED lights on |  |
| :---: | :---: |
|  |  |
|  |  |

Frequency Reference

| LED flashes |
| :---: |
| 1 V V |
| $\begin{aligned} & 17151717 \\ & 1012.218 \end{aligned}$ |

Set Frequency Reference

| Flashing digit <br> 10 |
| :---: |
|  |  |
|  |  |

- At power-up, the display will show the frequency reference setting and all LEDs are flashing. Press the $\boldsymbol{\triangle}(\mathrm{UP})$ or $\boldsymbol{\nabla}(\mathrm{DOWN})$ key to enter the frequency reference edit mode, use the $4 /$ RESET key to select which digit to edit (flashing). Use the $\boldsymbol{\Delta}$ (UP) or $\boldsymbol{\nabla}$ (DOWN) key to modify the value and press the READ / ENTER key to save the frequency reference and switch back to the frequency reference display mode.
- During run operation, the display will show the output frequency.

Note: When in edit mode and the READ / ENTER is not pressed within 5 sec, the inverter will switch back to the frequency reference display mode.

LED Display Examples

| Seven Segment Display | Description |
| :--- | :--- | :--- |

### 4.1.3 LED Indicator Description

- Fault LED

| State | Description | FAULT LED |
| :--- | :--- | :---: |
| Off | No Fault Active |  |
| Illuminated | Fault Active |  |

- Forward LED

| State | Description | FWD LED |
| :--- | :--- | :---: |
| Off | Inverter in reverse direction |  |
| Illuminated | Inverter is running in forward direction |  |
| Flashing | Forward direction active, no run command |  |

- Reverse LED

| State | Description | REV LED |
| :--- | :--- | :---: |
| Off | Inverter in forward direction |  |
| Illuminated | Inverter is running in reverse direction |  |
| Flashing | Reverse direction active, no run command |  |

- RUN LED

| State | Description | RUN LED |
| :--- | :--- | :---: |
| Off | Inverter stopped |  |
| Illuminated | Inverter running |  |
| Flashing | Inverter stopped or stopping |  |

- SEQ LED

| State | Description | SEQ LED |
| :--- | :--- | :---: |
| Off | Sequence controlled from keypad |  |
| Illuminated | Sequence set from external source |  |

REF LED

| State | Description | REF LED |
| :--- | :--- | :---: |
| Off | Frequency reference set from keypad |  |
| Illuminated | Frequency reference set from external source |  |

## Run / Stop Status Indicators

### 4.1.4 Power-up Monitor

- Power-up

- Changing Monitor at Power-up

| $12-00$ |  | Display Selection |
| :---: | :--- | :--- |
| Range | Highest bit $->\underline{0} \mathbf{0} \underline{0} \underline{0} \mathbf{0}<-$ Lowest bit |  |
|  | The setting range for each bit is $\mathbf{0} \sim \mathbf{7}$ from the highest bit to the lowest bit. |  |
|  | 0: No display | 4: Temperature |
|  | 1: Output current | 5: PID feedback |
|  | 2: Output voltage | 6: AI1 value |
|  | 3: DC voltage | 7: AI2 value |

Example: 12-00=【10000】

### 4.1.5 Modifying Parameters/ Set Frequency Reference

Example: Modifying Parameters

## Example: Set Frequency Reference

Inverter stopped:

Display Voltage Class
Flashing for 3 seconds
〈 VVVV

$\underbrace{\text { Press }}_{\text {Display Frequency Reference }}$

Set Frequency Reference 0.01 Hz

Set Frequency Reference 0.1 Hz

Set Frequency Reference completed.

Inverter is running:

Flashing for 3 seconds

〈 $\nabla \nabla \nabla \nabla>$

Press RUN $1 x$

Output Frequency

Set Frequency Reference

Inverter automatically reverts back to display the output frequency if no modifications are made within 5 sec.

Note: When upper or lower limit is reached during editing of the frequency reference, the edit value will automatically rollover from the lower limit to the upper limit or from the upper limit to the lower limit.

### 4.1.6 Operation Control

### 4.2 LCD keypad

### 4.2.1 Keypad Display and Keys

| DISPLAY | Description |
| :---: | :--- |
| LCD Display | Monitor inverter signals, view / edit parameters, fault / alarm display. |
| LED INDICATORS |  |
| FAULT | LED ON when a fault or alarm is active. |
| FWD | LED ON when inverter is running in forward direction, flashing when stopping. |
| REV | LED On when inverter is running in reverse direction, flashing when stopping. |
| SEQ | LED ON when RUN command is from the external control terminals or from <br> serial communication. |
| REF | LED ON when Frequency Reference command is from the external control <br> terminals or from serial communication. |

| KEYS (8) | Description |
| :---: | :--- |
| RUN | RUN inverter |
| STOP | STOP inverter |
| $\boldsymbol{\nabla}$ | Parameter navigation Up, Increase parameter or reference value |
| LOC/REM | Parameter navigation down, decrease parameter or reference value |
| DSP/FUN | Used to switch between Local Mode and Remote Mode <br> REMOTE Mode: Set by parameters, controlled by control circuit terminals, <br> communication or other ways. <br> LOCAL Mode: Controlled by operator. <br> It displays REMOTE Mode at power-up. Users can switch between LOCAL <br> and REMOTE Mode if they press LOC/ REM keys when the inverter stops. <br> Parameter of 23-41 can determine if LOC/REM keys are enabled or not. |
| $\boldsymbol{4} /$ RESET | Used to scroll to next screen <br> Frequence screen $\rightarrow$ Function selection $\rightarrow$ Monitor parameter |
| READ / ENTER | Selects active seven segment digit for editing with the $\boldsymbol{\Delta} \boldsymbol{\nabla}$ keys <br> Used to reset fault condition. |
| Used to read and save the value of the active parameter. |  |

## Auto-Repeat Keys

Holding the $\triangle$ UP or $V$ DOWN key for a longer period of time will initiate the auto-repeat function resulting in the value of the selected digit to automatically increase or decrease.

Note: HOA LCD keypad is available with an optional accessory.

### 4.2.2 Keypad Menu Structure

## - Main Menu

The F510 inverter main menu consists of two main groups (modes). The DSP/FUN key is used to switch between the monitor mode and the parameter group mode. Refer to Figure 4.2.2.1.

| Mode | Description |
| :--- | :--- |
| Monitor Mode | View inverter status, signals and fault data. |
| Parameter Group Mode | Access to available parameter groups. |

All the available parameter groups are listed in the Parameter Group Mode. Use the up and down keys to select a group and press READ/ ENTER to access its parameters.

Fig. 4.2.2.1 Parameter Group Structure

## Notes:

- Always perform auto-tune on the motor before operating the inverter in vector control (sensorless vector or flux vector). Auto-tuning mode will not be displayed when the inverter is running or when a fault is active.
- To scroll through the available modes, parameter groups or parameter list press and hold the up or down key.

## - Monitor Mode

In monitor mode inverter signals can be monitored such as output frequency, output current and output voltage, etc...) as well as fault information and fault trace. See Fig 4.2.2.2 for keypad navigation.

Fig 4.2.2.2 Monitor Mode

## - Programming Mode

In programming mode inverter parameters can be read or changed. See Fig 4.2.2.3 for keypad navigation.

Fig 4.2.2.3 Programming Mode

## Notes:

- The parameters values can be changed from the data set/read screen with the $\boldsymbol{\Delta}$ (up) or $\boldsymbol{\nabla}$ (down) and </ RESET shift key.
- To save a parameter press the READ/ENTER key. Return to the previous sub-menu screen press DSP/FUN key.
- Press the $\boldsymbol{A}$ (up) or $\boldsymbol{\nabla}$ (down) key to scroll parameter groups or parameter list. When pressing DSP/FUN in the parameter edit mode, it will return to the previous screen of parameter group mode; when pressing DSP/FUN in the parameter group mode, it will return to the previous screen of parameter group selection mode.
- Refer to section 4.4 for parameter details.

Fig 4.2.2.4 Parameter Group Selection Mode Screen

### 4.3 Parameters

| Parameter Group |  |
| :--- | :--- |
| Group 00 | Basic Parameters |
| Group 01 | VIF Control Parameters |

Note: 1. Standard H \& C type, IP20 frame 6~9 do not have 08-37 function.
2. Enhanced E \& G type, IP20 frame 6~8 do not have "Start at High Temperature" function.(08-37=2)
3. Enhanced E \& G type, IP20 frame 9 do not have 08-37 function.

## 4．4 Description of Parameters

## Group 00－Basic Parameters

| $00-00$ | Control Mode Selection |
| :--- | :--- |
|  | 【0】：V／F |
|  | 【1】：Reserved |
|  | $2 \mathbf{2}:$ SLV |
| Range | 【3】：Reserved |
|  | 【4】：Reserved |
|  | 【5】：PMSLV |

The inverter offers the following control modes：
$00-00=0$ ：V／F Mode
Select the required V／F curve（01－00）based on your motor and application．
Perform a stationary auto－tune（ $17-00=2$ ）．If the motor cable length is longer than 50 m （ 165 ft ），see parameter 17－00 for details．

00－00＝2：Sensorless Vector Control

Verify the inverter rating matches the motor rating．Perform rotational auto－tune to measure and store motor parameters for higher performance operation．Perform non－rotational auto－tune if it＇s not possible to rotate the motor during auto－tune．Refer to parameter group 17 for details on auto－tuning．

## 00－00＝5：PM Sensorless Vector Control

Verify the inverter rating matches the motor rating．Set PM motor data in parameters 22－00 to 22－06．Refer to parameter 22－21 for details on PM Motor tuning．A braking resistor is recommended to be used to prevent drive from getting regenerative energy．A braking module is required for Inverters ratings 200V $30 \mathrm{HP}, 400 \mathrm{~V} / 40 \mathrm{HP}$ or greater．

Note：Parameter 00－00 is excluded from initialization．

| $00-01$ | Motor＇s Rotation Direction |
| :---: | :--- |
| Range | 【0】：Forward |
|  | 【1】：Reverse |

Use the FWD／REV key to change motor direction when Run Command Selection $(00-02=0)$ is set to keypad control．In keypad control operation the direction is stored in 00－01．Direction of this function will be limited to the motor direction lock selection of parameter 11－00．

| $00-02$ | Main Run Command Source Selection |
| :--- | :--- |
| Range | 【0】：Keypad control |
|  | 【1】：External terminal control |
|  | 【2】：Communication control |
|  | 【3】：PLC |
|  | 【4】：RTC |

00－02＝0：Keypad Control
Use the keypad to start and stop the inverter and set direction with the forward／reverse key．Refer to section 4－1 for details on the keypad．

00－02＝1：External Terminal Control
External terminals are used to start and stop the inverter and select motor direction．
The inverter can be operated in 2－wire and 3－wire mode．

| $00-03$ | Alternative Run Command Source Selection |
| :--- | :--- |
| Range | 【0】：Keypad control |
|  | 【1】：External terminal control |
|  | 【2】：Communication control |
|  | 【3】：PLC |
|  | 【4】：RTC |

## 00－03＝0：Keypad Control

Use the keys（Stop／Run or FWD／REV）in the keypad via the setting of 00－03＝0 to run the inverter（please refer to section 4.1 for details on the keypad）．

00－03＝1：External Terminal Control
External terminals are used to start and stop the inverter and select motor direction via the setting of $00-03=1$ ．

Note：Assign the function of one of DI （S1 to S6）to be＂Run Command Switch Over＂（03－00～03－05＝12）， then the run command source can be switched over between the setting of main（00－02）and alternative （00－03）

## ■ 2－wire operation

For 2－wire operation，set 03－00（S1 terminal selection）to 0 and 03－01（ S 2 terminal selection）to 1 ．

| Terminal S1 | Terminal S2 | Operation |
| :--- | :--- | :--- |
| Open | Open | Stop Inverter |
| Closed | Open | Run Forward |
| Open | Closed | Run Reverse（Only at 11－00＝0） |
| Closed | Closed | Stop Inverter，Display EF9 Alarm after 500ms |

Parameter 13－08 to 2,4 or 6 for 2－wire program initialization，multi－function input terminal S 1 is set to forward，operation／stop，and S2 is set for reverse，operation／stop．

Figure 4．4．1 Wiring example of 2－wire

## - 3-wire operation

For 3-wire operation set any of parameters 03-02 to 03-05 (terminal S3 ~ S6) to 26 to enable 3-wire operation in combination with S1 and S2 terminals set to operation command and stop command.

Parameter 13-08 for 3-wire program initialization, multi-function input terminal S1 is set to run operation, S2 for stop operation and S5 for forward/reverse command. (Additionally must be 00-02=1, 11-00=0)

Note: Terminal S1 must be closed for a minimum of 50 ms to activate operation.

Figure 4.4.2 Wiring example of 3-wire

Figure 4.4.3 Timing chart of 3-wire operation

## ■ 2-wire self holding (latching) operation

Set one of parameters, 03-00 to 03-05 (terminal S1 ~ S6), to 53 in order to enable 2-wire self holding operation. After this mode is enabled, set terminal $\mathrm{S} 1(03-00=0)$ to forward and $\mathrm{S} 2(03-01=1)$ to reverse run command.

Note: Terminal S1, S2 and S5 must be closed for a minimum of 50 ms to activate operation. The inverter will display SE2 error when input terminals S1-S6 is set to 53 and 26 simultaneously.

00-02=2: Communication control
The inverter is controlled by the RS-485 port. Refer to parameter group 9 for communication setup.
00-02=3: PLC control
The inverter is controlled by the inverter built-in PLC logic. Refer to section 4.4.
00-02=4: RTC control
The inverter is controlled by RTC timer when run command is set to RTC. Refer to function group 16.

| $00-04$ | Language Selection（for LCD only） |
| :--- | :--- |
| Range | 【0】：English |
|  | 【1】：Simple Chinese |
|  | 【3】：Traditional Chinese |
|  | 【3】：Turkish |

It is only for LCD keypad to select．This parameter is not allowed to be modified when 13－08（restore factory setting）is active but it is still initialized in inverter software V1．3）．

| $00-05$ | Main Frequency Command Source Selection |
| :--- | :--- |
| $00-06$ | Alternative Frequency Source Selection |
|  | 【0】：Keypad |
|  | 【1】：External control（analog AI1） |
|  | 【2】：Terminal UP／DOWN |
| Range | 【3】：Communication control |
|  | 【4】：Reserved |
|  | 【5】：Reserved |
|  | 【6】：RTC |
|  | 【7】：Al2 Auxiliary frequency |

00－05／00－06＝0：Keypad
Use the keypad to enter the frequency reference or by setting parameter 05－01（frequency reference 1）． Note that once the frequency command is switched to alternative one，and 00－06＝0，the frequency just can be adjusted via parameter 05－01．Refer to section 4．1．4 for details．

00－05／00－06＝1：External control（Analog Input）
When $04-05=0$ ，give frequency reference command from control circuit terminal Al1（voltage input）．If auxiliary frequency is used，refer to the descriptions of multi－speed functions in parameter 03－00～05．

When frequency reference command is control by either Al1 or Al2，please regard the following setting：
（1）00－05／00－06 are set individually to be 1 and 7 ．
（2）Set AI2 signal type in 04－00（Al1 is always 0～10V）．
（3）Set 04－05＝0（Auxiliary frequency setting）．
（4）Set multi－function terminal function of 03－00～05 to be 13，then frequency reference command can be switched to Al1 control or Al2 control．

When 04－05＝1，give frequency reference command from control circuit terminal Al1（voltage input）or Al2 （current input，set by 04－00）．

Use Al1 terminal when voltage input signal is the main frequency reference command．
Use AI2 terminal when current input signal（ $4-20 \mathrm{~mA}$ ）is the main frequency reference command．
Use analog reference from analog input Al1 or Al2 to set the frequency reference（as shown in Figure 4．4．4）．Refer to parameter 04－00 to select the signal type．

|  | Voltage input | Current input | 04-00 Setting (Default = 1) | Dipswitch SW2 (Default 'V') | Remark Default 04-05="10" |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Al1 - Analog Input 1 | 0~10V | ------ | ------ | ------ | ------ |
| Al2 - Analog Input 2 | 0~10V | -- | 0: Al2 0~10V | Set to 'V' | Set 04-05="10" (Note) |
|  | ------- | 4 ~ 20mA | 1: Al2 4~20mA | Set to "I" |  |

Note: Set parameter 04-05 to 10 to add frequency reference Al 2 to Al 1 .

Figure 4.4.4 Analog input as main frequency reference command (For Enhanced E\&G type)

## 00-05/00-06= 2: Terminal UP / DOWN

The inverter accelerates with the UP command closed and decelerates with the DOWN command closed. Please refer to parameter 03-00 ~ 03-05 for additional information.

Note: To use this function both the UP and DOWN command have to be selected to any of the input terminals.

00-05/00-06=3: Communication Control
The frequency reference command is set via the RS-485 communication port using the MODBUS RTU/ BacNet/ MetaSys protocol.

Refer to parameter group 9 for additional information.

## 00-05/00-06= 6: RTC

Enables RTC control, reference frequency is controlled by the RTC function, Refer to parameter group 16 for RTC setup.
$00-05 / 00-06=7$ : Al2 Auxiliary frequency ${ }^{* 1}$
When 04-05 is set to 0 (auxiliary frequency), frequency command is set by multi-function analog input Al 2 . Maximum output frequency ( $01-02$, Fmax) $=100 \%$; if $04-05$ is not set to 0 , the frequency is 0 . Refer to the parmeters of 03-00~03-07 for descriptions of multi-speed functions.

| $00-07$ | Main and Alternative Frequency Command Modes |
| :---: | :--- |
| Range | 【0】：Main reference frequency |
|  | 【1】：Main frequency＋alternative frequency |

When set to 0 ，the reference frequency is set by the main reference frequency selection of parameter $00-05$ ．When set to 1 ，the reference frequency is sum of the main reference frequency（00－05）and alternative frequency（00－06）．

Note：The inverter will display the SE01 error when 00－07＝ 1 and parameter 00－05 and 00－06 are set to the same selection．

When parameter 00－06 is set to 0 （Keypad）the alternative frequency reference is set by parameter 05－01 （Frequency setting of speed－stage 0 ）．

| $00-08$ | Communication Frequency Command－READ ONLY |
| :--- | :--- |
| Range | $【 0.00 \sim 599.00 】 \mathrm{~Hz}$ |

Display the frequency reference when $00-05$ or $00-06$ is set to communication control（3）．

| $00-09$ | Communication Frequency Command Memory |
| :---: | :--- |
| Range | 【0】：Do not store the communication frequency command at power down |
|  | $【 1 】:$ Store communication frequency reference at power down |

Note：This parameter is only effective in communication mode．

| $00-10$ | Minimum frequency detection |
| :---: | :--- |
| Range | $【 0 】:$ Show warning if lower than minimum frequency |
|  | $【 1 】:$ Run as minimum frequency if lower than minimum frequency |

## $00-10=0$ ：

When frequency command is lower than 01－08（Minimum Output Frequency of Motor 1），it shows STP0 warning．
$00-10=1$ ：
When frequency command is lower than 01－08（Minimum Output Frequency of Motor 1），inverter runs as minimum output frequency of motor 1 ．

| $00-11$ | Selection of PID Lower Limit Frequency |
| :---: | :--- |
| Range | $【 0 】:$ PID is bound to lower limit frequency when inverter sleeps． |
|  | $【 1 】:$ PID is bound to 0 Hz when inverter sleeps． |

When inverter gets to sleep，
$\mathbf{0 0 - 1 1 = 0}$ ：PID is bound to lower limit frequency（00－13）．
$00-11=1$ ：PID is bound to 0 Hz ．

Note：Refer to descriptions of parameters 10－17～10－20 for details when inverter gets to sleep．

| $\mathbf{0 0 - 1 2}$ | Upper Limit Frequency |
| :---: | :--- |
| Range | $【 0.1 \sim 109.0 】 \%$ |
| $\mathbf{0 0 - 1 3}$ | Lower Limit Frequency |
| Range | $【 0.0 \sim 109.0 】 \%$ |

Set the minimum frequency reference as a percentage of the maximum output frequency．Maximum output frequency depends on frequency parameter 01－02．

## Notes：

－When the frequency lower limit is set to a value greater than 0 and the inverter is started the output frequency will accelerate to the frequency lower limit with a minimum frequency defined by parameter 01－08．
－Frequency upper limit has to greater or equal to the frequency lower limit otherwise the inverter will display a SE01（Set range error）．
－Frequency upper and lower limit is active for all frequency reference modes．

Figure 4．4．5 Frequency reference upper and lower limits
Note：The maximum frequency setting in the keypad is according to parameter 01－02（Maximum Output Frequency）and 00－12（Upper Frequency limit）．The upper frequency limit is not over than 599 Hz and maximum limit for Al frequency is $100 \%$ to parameter 01－02．

| 00－14 | Acceleration Time 1 |
| :---: | :---: |
| Range | 【0．1～6000．0】 Sec |
| 00－15 | Deceleration Time 1 |
| Range | 【0．1～6000．0】 Sec |
| 00－16 | Acceleration Time 2 |
| Range | 【0．1～6000．0】 Sec |
| 00－17 | Deceleration Time 2 |
| Range | 【0．1～6000．0】 Sec |
| 00－21 | Acceleration Time 3 |
| Range | 【0．1～6000．0】 Sec |
| 00－22 | Deceleration Time 3 |
| Range | 【0．1～6000．0】 Sec |
| 00－23 | Acceleration Time 4 |
| Range | 【0．1～6000．0】 Sec |
| 00－24 | Deceleration Time 4 |
| Range | 【0．1～6000．0】 Sec |
| 00－25 | Switching Frequency of Acceleration and Deceleration |
| Range | 【0．00～599．00】 Hz |

Acceleration time is the time required to accelerate from 0 to $100 \%$ of maximum output frequency. Deceleration time is the time required to decelerate from 100 to $0 \%$ of maximum output frequency. Motor 1: Maximum frequency is set by parameter 01-02 and Motor 2 Maximum frequency is set by parameter 01-16.

Note: Actual acceleration and deceleration times can be affected by the inverter driven load.

The default values for the acceleration, deceleration times are dependent on the inverter size.

| Size |  | Acceleration / Deceleration <br> Default Value |
| :---: | :---: | :---: |
| 200V Class | 400V Class | 10 s |
| $1 \sim 15 \mathrm{HP}$ | $1 \sim 20 \mathrm{HP}$ | 15 s |
| $20 \sim 30 \mathrm{HP}$ | $25 \sim 40 \mathrm{HP}$ | 20 s |
| $40 \sim 175 \mathrm{HP}$ | $50 \sim 800 \mathrm{HP}$ |  |

## A: Select acceleration and deceleration time via the digital input terminals

The following table shows the acceleration / deceleration selected when the digital input function Accel/Decel time 1 (\#10) and Accel/Decel time 2 1(\#30) are used.

Table 4.4.1 Acceleration / deceleration time selection

| Accel/decel time 2 <br> $($ Set 03-00 ~ 03-05 = 30) | Accel/decel time 1 <br> (Set 03-00 to 03-05 = 10) | Acceleration <br> time | Deceleration <br> time |
| :---: | :---: | :---: | :---: |
| 0 | 0 | Taccc1 $(00-14)$ | Tdec1 (00-15) |
| 0 | 1 | Taccc2 $(00-16)$ | Tdec2 (00-17) |
| 1 | 0 | Taccc3 $(00-21)$ | Tdec3 (00-22) |
| 1 | 1 | Taccc4 $(00-23)$ | Tdec4 (00-24) |

0: OFF, 1: ON

Figure 4.4.6: Terminal S5 switch between Tacc1/Tacc2 and Tdec1/Tdec2

## B. Automatically acceleration / deceleration time switch-over based on output frequency

Set acceleration / deceleration switch over frequency parameter 00-25 to a value greater than 0 to automatically switch between Tacc1 (00-14) / Tdec1 (00-23) and Tacc4 (00-24) / Tdec4 (00-15).

Tacc1 (00-14) / Tdec1 (00-23) are active when the output frequency $<00-25$ and Tacc4 (00-24) / Tdec4 $(00-15)$ are active when the output frequency $>=00-25$. Refer to the Figure 4.4 .7 for details.

Note：Multi－function input function \＃10（Accel／Decel time 1）and \＃30（Accel／Decel time 2）have a higher priority than switch over frequency parameter 00－25．

Figure 4．4．7 Automatic acceleration／deceleration time switch－over based on output frequency

| $00-18$ | Jog Frequency |
| :---: | :--- |
| Range | $【 0.00 \sim 599.00 】 \mathrm{~Hz}$ |
| $00-19$ | Jog Acceleration Time |
| Range | $【 0.1 \sim 0600.0 】$ Sec |
| $\mathbf{0 0 - 2 0}$ | Jog Deceleration Time |
| Range | $【 0.1 \sim 0600.0 】$ Sec |

Jog acceleration time（00－19）is the time required to accelerate from 0 to $100 \%$ of maximum output frequency．Jog deceleration time（00－20）is the time required to decelerate from 100 to $0 \%$ of maximum output frequency．Motor 1：Maximum frequency is set by parameter 01－02 and Motor 2 Maximum frequency is set by parameter 01－16．
When run command selection is external terminal control（00－02＝1）and the inverter uses the jog frequency（ $00-18$ ，default 6.0 Hz ）as its frequency reference with $03-00 \sim 03-07=6$ or 7 （6：Forward jog run command 7：Reverse jog run command）．The motor will run by the setting．

| $00-26$ | Emergency Stop Time |
| :--- | :--- |
| Range | $【 0.0 \sim 6000.0 】$ Sec |

The emergency stop time is used in combination with multi－function digital input function \＃14（Emergency stop）．When emergency stop input is activated the inverter will decelerate to a stop using the Emergency stop time（00－26）and display the［EM STOP］condition on the keypad．

Note：To cancel the emergency stop condition the run command has to be removed and emergency stop input deactivated．

Multi－function digital input terminals（03－00～03－05）are set to 14：When the emergency stop input is activated the inverter will decelerate to a stop using the time set in parameter 00－26．
Note：After an emergency stop command the run command and emergency stop command have to be removed before the inverter can be restarted．Please refer to Figure 4．4．8．The emergency stop function can be used to stop inverter in case of an external event．

Multi－function digital input terminals（03－00～03－05）set to 15 ：When the base block input is activated the inverter output will turn off and the motor will coast to a stop．

Figure 4．4．8 Emergency stop example

| $00-28$ | Selection of Main Frequency Command Characteristic |
| :---: | :--- |
| Range | 【0】：Positive characteristic（0～10V／4～20mA $=0 \sim 100 \%)$ |
|  | $【 1 】:$ Negative $/$ inverse characteristic $(0 \sim 10 \mathrm{~V} / 4 \sim 20 \mathrm{~mA}=100 \sim 0 \%)$ |

$\mathbf{0 0 - 2 8}=\mathbf{0}$ ：Positive reference curve， $0-10 \mathrm{~V} / 4-20 \mathrm{~mA}=0-100 \%$ main frequency reference．
$\mathbf{0 0 - 2 8 = 1}$ ：Negative reference curve， $0-10 \mathrm{~V} / 4-20 \mathrm{~mA}=100-0 \%$ main frequency reference．

Note：Selection applies to analog input AI1 and AI2．
Note：Al2 will be useful for analog input frequency command when 04－05＝0．

Figure 4．4．9 Positive／negative analog input as main frequency reference command．

| 00－32 | Application |
| :---: | :---: |
| Range | 【0】 ：General |
|  | 【1】 ：Water supply pump |
|  | 【2】：Conveyor |
|  | 【3】 ：Exhaust fan |
|  | 【4】 ：HVAC |
|  | 【5】 ：Compressor |
|  | 【6】 ：Reserved |
|  | 【7】 ：Reserved |

Note：If set 00－32 back to 0,2 wire initialization $(60 \mathrm{~Hz})(230 / 400 \mathrm{~V})$ setting（ $13-08=11$ ）will be executed．
Note：Before setting up 00－32 Application，it should do initialized setting（parameter 13－08）first．
Warning：When setting 00－32，the I／O port function changed automatically．To avoid accident，be sure to confirm the I／O port signal of inverter and external terminal control
(1) Water supply pump

| Parameter | Name | Value |

Note: 01-00 (V/F pattern) will hidden automatically.

## (6) Reserved

(7) Reserved

| $00-33$ | Modified Parameters |
| :---: | :--- |
| Range | 【0】：Disable |
|  | 【1】：Enable |

Note：only for LCD keypad．

This parameter automatically lists all the adjusted parameters．When the default value is adjusted and $00-33=1$ ，it will list all the parameters different from default values in the advanced modes and these parameters can be edited directly．The adjusted parameters list displays only when 00－33 is set from 0 to 1 or 00－33＝1 at start up．

If user wants to restore to the original editing interface，it is only required to set parameter 00－33＝0．

This function can display 250 adjusted parameters．If they are more than 250 parameters，it will list the adjusted parameters before 250 ．

Example：set 00－03（Alternative Run Command Source Selection）to be different default value．

| Steps | LCD Display | Descriptions |
| :---: | :---: | :---: |

| 3 |  | Press READ／ENTER key and adjust the value．The selected setting value will flash． |
| 4 | PARA 00 <br> －33． Modify parameter <br> －41． User P1 <br> -42. User P2 | Press DSP／FUN to the menu of modified parameters（00－33）． |
| 5 |  | Press READ／ENTER key to adjust the value to 1 （The modified parameter is enabled．）The selected setting value will flash． |
| 6 | Modify 00 <br> $00-03$. Sub RUN Source <br> 00－33． Modify parameter | Press DSP／FUN back to the advanced modes． |

User Parameter Setting (00-41~00-56) (only for LCD )

| $00-41$ | User Parameter 0 Function Setting |
| :--- | :--- |
| $00-42$ | User Parameter 1 Function Setting |
| $00-43$ | User Parameter 2 Function Setting |
| $00-44$ | User Parameter 3 Function Setting |
| $00-45$ | User Parameter 4 Function Setting |
| $00-46$ | User Parameter 5 Function Setting |
| $00-47$ | User Parameter 6 Function Setting |
| $00-48$ | User Parameter 7 Function Setting |
| $00-48$ | User Parameter 8 Function Setting |
| $00-50$ | User Parameter 9 Function Setting |
| $00-51$ | User Parameter 10 Function Setting |
| $00-52$ | User Parameter 11 Function Setting |
| $00-53$ | User Parameter 12 Function Setting |
| $00-54$ | User Parameter 13 Function Setting |
| $00-55$ | User Parameter 14 Function Setting |
| $00-56$ | User Parameter 15 Function Setting |

- User parameter (00-41~00-56) can select 16 sets of parameters (group $00 \sim 24$, but except 00-00/ 00-41~00-56/ group 17) and put them into the list to do the fast access setting.
- When the access setting of parameter 13-06 is set to 1 , user parameter 00-41 $\sim 00-56$ can be displayed and changed.
- User parameter 00-41 $\sim 00-56$ can be changed in the advanced modes, exclusive of being in operation.
- Set value in the parameter of 00-41 $\sim 00-56$ and set 13-06 to 1 .
- When 13-06=1, only parameter of 00-00 $\sim 00-56$ can be set or read in the advanced modes. 13-06=1 is enabled in the parameter setting of 00-41~00-56.
- When user would like to leave the screen of user parameters, press RESET key and then DSP/FUN key to select parameter Group 13.

Example 1: Set 03-00 (Multi-function terminal Function Setting-S1) to user parameter 0 (00-41)

| Steps | LCD Display | Descriptions |
| :---: | :---: | :---: |
| 1 | Group <br> 00 Basic Func. <br> 01 V/F Pattern <br> 02 Motor Parameter | Select the start parameter group (00) in the advanced modes. |

The automatically return time can be set via 16-06. |

## User Parameter Run Mode Structures

A. Define Parameter Group 0~24 as user parameters except parameter 00-00 and 00-41~00-56.
[ Main Screen ] [ Main Menu] [ Rubdirectroy] END ENTER]

Note: User level (13-06=1) can be set by one or more parameters in the user parameters of 00-41~ 00-56.
[ Main Screen ] [ Main Menu ] Subdirectory] [READ / ENTER]

## Group 01-V/F Control Parameters

| $01-00$ | V/F Curve Selection |
| :---: | :--- |
| Range | 【0~FF】 |

$*$ When restore factory setting (13-08), this parameter will not be changed.

The V/F curve selection is enabled for V/F mode. Make sure to set the inverter input voltage parameter 01-14.

There are three ways to set V/F curve:
(1) $01-00=0$ to $E$ : choose any of the 15 predefined curves ( 0 to $E$ ).
(2) 01-00 $=0 \mathrm{~F}$, use 01-02~01-09 and 01-12 ~ 01-13, with voltage limit.
(3) $01-00=$ FF: use 01-02~01-09 and 01-12 $\sim 01-13$, without voltage limit.

The default parameters (01-02 $\sim 01-09$ and 01-12 $\sim 01-13$ ) are the same when 01-00 is set to $F$ (default) and $01-00$ is set to 1 .

Parameters 01-02 ~ 01-13 are automatically set when any of the predefined V/F curves are selected.

This parameter will be affected to reset by the initialization parameter (13-08).

Consider the following items as the conditions for selecting a V/F pattern.
(1) The voltage and frequency characteristic of motor.
(2) The maximum speed of motor.

Table 4.4.2 1-30HP V/F curve selection

| Type | Specification | 01-00 | V/F curve ${ }^{* 1}$ |
| :---: | :---: | :---: | :---: | :---: |

| Range | 【4．8～599．0】 Hz |
| 01－03 | Maximum Output Voltage |
| Range | $\begin{aligned} & \text { 200V:【0.1~255.0】 V } \\ & \text { 400V:【0.2~510.0】 V } \\ & \hline \end{aligned}$ |
| 01－04 | Middle output frequency 2 |
| Range | 【0．0～599．0】 Hz |
| 01－05 | Middle Output Voltage 2 |
| Range | $\begin{aligned} & \text { 200V:【0.0~255.0】 V } \\ & \text { 400V:【0.0~510.0】 V } \end{aligned}$ |
| 01－06 | Middle Output Frequency 1 |
| Range | 【0．0～599．0】 Hz |
| 01－07 | Middle Output Voltage 1 |
| Range | $\begin{aligned} & \text { 200V:【0.0~255.0】 V } \\ & \text { 400V:【0.0~510.0】 V } \end{aligned}$ |
| 01－08 | Minimum Output Frequency |
| Range | 【0．0～599．0】 Hz |
| 01－09 | Minimum Output Voltage |
| Range | $\begin{aligned} & \text { 200V:【0.0~255.0】 V } \\ & \text { 400V:【0.0~510.0】 V } \end{aligned}$ |
| 01－12 | Base Frequency |
| Range | 【4．8～599．0】 Hz |
| 01－13 | Base Output Voltage |
| Range | $\begin{aligned} & \text { 200V: 【0.0~255.0】 V } \\ & \text { 400V: 〔0.0~510.0】 V } \end{aligned}$ |

V／F curve setting（01－02～01－09 and 01－12～01－13）
Select any of the predefined V／F curves setting＇ 0 ＇to＇$E$＇that best matches your application and the load characteristic of your motor，choose a custom curve setting＇F＇or＇FF＇to set a custom curve．

## Important：

Improper V／F curve selection can result in low motor torque or increased current due to excitation．

For low torque or high speed applications，the motor may overheat．Make sure to provide adequate cooling when operating the motor under these conditions for a longer period of time．

If the automatic torque boost function is enabled（parameter 01－10），the applied motor voltage will automatically change to provide adequate motor torque during start or operating at low frequency．

## Custom V／F Curve Setting：

A custom curve selection allows users to set parameters 01－02～01－13 whereas a predefined curve selection does not．

Figure 4.4.10 Custom V/F curve
When setting the frequency related parameters for a custom V/F curve values make sure that:
$\underset{(01-02)}{F_{\text {max }}} \geqq \underset{(01-12)}{F_{\text {base }}}>\underset{(01-04)}{F_{\text {mid2 }}}>{ }_{(01-06)}^{F_{\text {mid1 }}}>{ }_{(01-08)}$

The 'SE03' V/F curve tuning error is displayed when the frequency values are set incorrectly.
When 01-04 and 01-05 (or 01-18 and 01-09) are set to 0 , the inverter ignores the set values of Fmid2 and Vmid2.

When the control mode is changed parameter 00-00, 01-08 ( $\mathrm{F}_{\mathrm{min}}$ ) and 01-09 ( $\mathrm{V}_{\mathrm{min}}$ ) will automatically be changed to the default setting of the selected control mode.

## SLV (Sensorless vector control)

Enter the motor data in parameter group 17 for SV and SLV control mode (00-00) and perform auto-tuning.
In the SLV mode the V/F curve normally does not have to be re-adjusted after a successful auto-tune.
The maximum output frequency setting 01-02 (Fmax), base frequency 01-12 (Fbase) or minimum output frequency 01-08 (Fmin) can be adjusted but the voltage is automatically adjusted by the internal current controller.

Set the base frequency (01-12, Fbase) to the motor rated frequency on the motor nameplate.
Perform the auto-tuning procedure after adjusting parameters $02-19$ or 17-04 to reduce the voltage at no-load operation.

Motor jitter can be reduced by lowering the no-load voltage. Please note that lowering the no-load voltage increases the current at no-load.

| $01-10$ | Torque Compensation Gain |
| :--- | :--- |
| Range | 【0.0~2.0】 |

In V/F mode the inverter automatically adjusts the output voltage to adjust the output torque during start or during load changes based on the calculated loss of motor voltage.

The rate of adjustment can be changed with the torque compensation gain parameter.
Refer to the torque compensation gain adjustment shown in Figure 4.4.11.

Figure 4.4.11 Torque compensation gain to increase/decrease output torque
Increase value when:

- The wiring between the inverter and the motor is too long
- The motor size is smaller than the inverter size

Note: Gradually increase the torque compensation value and make sure the output current does not exceed inverter rated current.

Reduce value when:

- When experiencing motor vibration

## Important:

Confirm that the output current at low speed does not exceed the rated output current of the inverter.

| 01-11 | Selection of Torque Compensation Mode |
| :---: | :--- |
| Range | 0: Torque Compensation Mode 0 <br> 1: Torque Compensation Mode 1 |

01-11=0: General torque compensation mode.

01-11=1: High-speed torque compensation mode (120~160Hz).
Compensation amount decreases as the frequency increases. Compensation in $0 \sim 120 \mathrm{~Hz}$ is the same as that in torque compensation mode 0 .

| $01-14$ | Input Voltage Setting |
| :---: | :--- |
| Range | 200V：【155．0～255．0】 V <br>  400V：【310．0～510．0】 V |

The minimum input voltage of inverter is 0.1 V ．
Set the inverter input voltage（E．g．200V／208V／230V／240V or 380V／415V／440V／460V／480V）．

This parameter is used as a reference for predefined $V / F$ curve calculation（ $01-00=0$ to $E$ ），over－voltage protection level，stall prevention，etc．．．

Note：It will depend on restore factory setting（13－08）to set the value of voltage

## 01－15 $\quad$ Torque Compensation Time <br> Range 【0～10000】 ms

Set the torque compensation delay time in milliseconds．
Only adjust in the following situations：

Increase value when：
－When experiencing motor vibration
Decrease value when：
－When motor torque response is too slow

## Group 02－IM Motor Parameter

| 02－00 | No－load Current |
| :---: | :---: |
| Range | 【0．01～600．00】 A |
| 02－01 | Rated Current |
| Range | 25\％ $200 \%$ of inverter＇s rated current． |
| 02－03 | Rated Rotation Speed |
| Range | 【0～60000】 rpm |
| 02－04 | Rated Voltage |
| Range | $\begin{aligned} & \text { 200V:【50.0~240.0】 V } \\ & \text { 400V: 【100.0~480.0】 V } \end{aligned}$ |
| 02－05 | Rated Power |
| Range | 【0．01～600．00】 KW |
| 02－06 | Rated Frequency |
| Range | 【4．8～599．0】 Hz |
| 02－07 | Poles |
| Range | 【2～16】（Even） |
| 02－09 | Excitation Current＜1＞ |
| Range | 【15．0～70．0】 \％ |
| 02－10 | Core Saturation Coefficient $1<1>$ |
| Range | 【0～100】 \％ |
| 02－11 | Core Saturation Coefficient $2<1>$ |
| Range | 【0～100】 \％ |
| 02－12 | Core Saturation Coefficient $3<1>$ |
| Range | 【80～300】 \％ |
| 02－13 | Core Loss |
| Range | 【0．0～15．0】 \％ |
| 02－15 | Resistance between Wires |
| Range | 【0．001～60．000】 $\Omega$ |
| 02－19 | No－Load Voltage |
| Range | $\begin{aligned} & \text { 200V: 【50~240】 V } \\ & \text { 400V:【100~480】 V } \end{aligned}$ |
| 02－33 | Leakage Inductance Ratio＜ 1 ＞ |
| Range | 【0．1～15．0】 \％ |
| 02－34 | Slip Frequency＜ 1 ＞ |
| Range | 【0．1～20．0】 Hz |

In most case no adjustment is required after performing an auto－tune except when using the inverter in special applications（e．g．machine tool，positioning，etc．．．）．

Please refer to parameter group 22 for permanent magnet motor parameters．
（1）Number of motor poles（02－07）
Set the number of motor pole according to the motor nameplate．
（2）Motor rated power（02－05）
Set the motor power according to the motor nameplate．
（3）Motor rated current（02－01）
Set the motor rated current according to the motor nameplate．
(4) Motor rated voltage (02-04)

Set the motor rated voltage according to the motor nameplate.
(5) Rated frequency of motor (02-06)

Set the motor rated frequency according to the motor nameplate.
(6) Rated rotation speed of motor (02-03)

Set the motor rpm according to the motor nameplate.
(7) No-load motor voltage (02-19)

Parameter determines the rated flux during motor's rated rotation in SLV control mode. Set the value of this parameter to the same value as parameter 17-08 (02-19 for motor 2 ). A value of 10~50V below the input voltage level ensures that the motor is capable of providing adequate torque performance when operating at nominal speed (or higher speed). Setting the value to small can result in a reduction in no-load current, weakened motor flux and an increase in motor current while the motor is loaded.
(8) Motor excitation current (02-09)

- This parameter is automatically set via auto-tuning. It required manual adjustment without auto-tuning.
- Start tunig from $33 \%$ when doing manual adjustment. If the output value of no-load voltage (12-67) is higher than the setting value of no-load voltage (17-08), the motor excitation current is adjusted downward; if the value (12-67) is lower than the value (17-08), the motor excitation current is adjusted upward.
- Adjust the value of motor excitation current (02-09) will change the value of the motor leakage inductance (02-17) and motor mutual inductance (02-18).
(9) Setting of motor core saturation coefficients 1,2 and 3 (02-10, 02-11, 02-12)

These parameters are automatically set during auto-tune. No adjustment required. Parameters are set to $50 \%$ for $02-10,75 \%$ for $02-11$ and $137.5 \%$ for $02-12$ to reduce the impact of core saturation. The motor core's saturation coefficient is defined as a percentage of the motor excitation current. When the motor flux reaches $137.5 \%$ level, the core's saturation coefficient shall be greater than $137.5 \%$. When the motor flux is $50 \%$ or $75 \%$, the core's saturation coefficient is required to be less than $50 \%$ and $75 \%$.

(10) Motor core loss (02-13)

Set motor core loss as the percentage of the motor rated power.

$$
\% W_{\text {core }}(02-13)=\frac{3 \times \text { Motor core loss }(w a t t)}{\text { Motor rated power (watts, 02-05) }} \times 100 \%
$$

Note: In V/F mode motor core loss (02-13) is used to for torque compensation.
(11) Motor line to line resistance (02-15)
(12) Motor no-load current (02-00).

Value is calculated based on the motor rated frequency (17-05) and motor rated current (17-03).
In V / F control mode, the output current is greater than the no-load current with slip compensation is enabled.

Note: The value of 02-01 needs to be greater than the value set in parameter 02-00, otherwise warning message "SE01" out of range error will be displayed.

Figure 4.4.12 Y-equivalent model of an induction motor
(13) Motor Leakage Inductance Ratio (02-33)

- This parameter is set by the conversion of manual adjustment function. This adjustment does not have the magnetic function. Normally, it does not require adjustment.
- Definition of leakage inductance ratio is the ratio of leakage inductance to rotor inductance. If default setting is $3.4 \%$, adjust this ratio changes the parameter of motor leakage inductance. The formula of this ratio is as follows:

$$
\xi=\frac{L I K g}{L r}
$$

- When the ratio of leakage inductance is too high or too low, it may cause the motor jittering with different sound and without operation. The general setting range is $3.0 \% \sim 5.0 \%$ and $4.0 \%$ is the relatively common value for motor operation normally. The ratio of leakage inductance is adjusted depending on different motor types.
(14) Motor Slip Frequency (02-34)
- This parameter is set by the conversion of manual adjustment function. This adjustment does not have the magnetic function. Normally, it does not require adjustment.
- The default setting is 1 Hz and the value of motor slip frequency is obtained from motor nameplate. Take 4 -pole motor with 60 Hz for example,

Synchronous speed is $N=\frac{120 \times \text { Frequence }}{\text { Pole }}=\frac{120 \times 60}{4}=1800 \mathrm{rpm}$ and the rated speed in the
motor nameplate is 1700 rpm , then Slip $=\frac{1800-1700}{60}=1.67 \mathrm{~Hz}$.

Note: Adjusting the motor slip frequency changes the parameter of rotor resistance and the value of slip frequency is adjusted depending on different motor types.

Note: After executing auto-tuning, parameters which marked <1> will renew the value. Please refer Group 17: Automatic Tuning Parameters for more detail.

Refer to the multi－function digital input and related parameters in the following Fig．4．4．13

Figure 4．4．13 Multi－function digital input and related parameters

Table 4.4.4 Multi-function digital input setting (03-00 ~ 03-05) ("O": Enable, "X": Disable)

| Value | Function |  | Description | Control mode |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Name | LCD Display |  | V/F | SLV | $\begin{array}{\|l\|} \hline \text { PM } \\ \text { SLV } \\ \hline \end{array}$ |
| 0 | 2-wire type (Forward operation) | $\begin{aligned} & \text { 2-Wire } \\ & \text { (FWD-RUN) } \end{aligned}$ | 2- wire (ON : Forward operation command). | 0 | 0 | 0 |
| 1 | 2-wire type (Reverse operation) | $\begin{aligned} & \text { 2-Wire } \\ & \text { (REV-RUN) } \end{aligned}$ | 2- wire (ON : Reverse operation command). | 0 | 0 | 0 |
| 2 | Multi-Speed Setting Command 1 | Muti-Spd Ref 1 | Multi-Speed Reference 1 | O | 0 | 0 |
| 3 | Multi-Speed Setting Command 2 | Muti-Spd Ref 2 | Multi-Speed Reference 2 | 0 | 0 | 0 |
| 4 | Multi-Speed Setting Command 3 | Muti-Spd Ref 3 | Multi-speed Reference 3 | O | 0 | 0 |
| 5 | Multi-Speed Setting Command 4 | Muti-Spd Ref 4 | Multi-speed Reference 4 | 0 | 0 | 0 |
| 6 | Forward Jog Run Command | FJOG | ON: Forward operation in jog mode (00-18) | O | 0 | 0 |
| 7 | Reverse Jog Run Command | RJOG | ON: Reverse operation in jog mode (00-18) | O | 0 | 0 |
| 8 | UP Frequency Increasing Command | UP command | ON: Command of output frequency increasing (only used by support of DOWN command). | O | 0 | 0 |
| 9 | DOWN Frequency Decreasing Command | DOWN command | ON: Command of output frequency decreasing (only used by support of UP command). | 0 | 0 | 0 |
| 10 | Acceleration/ Deceleration Setting Command 1 | Acc/Decel Time Selection 1 | Acceleration/deceleration time selection command1 | 0 | 0 | 0 |
| 11 | Acceleration/ Deceleration Inhibition Command | ACC/DEC <br> Inhibit | ON: Acceleration/deceleration prohibition | 0 | 0 | 0 |
| 12 | Main/Alternative Run command Switching | Run Change Sel | Run command source is set by alternative run command (00-03). | O | 0 | 0 |
| 13 | Main/Alternative Frequency Command Switching | Freq Change Sel | Frequency command source is set by alternative frequency command (00-06). | O | 0 | 0 |

$03-0 X=00$ : 2 -wire control: forward operation
$\mathbf{0 3 - 0 X}=\mathbf{0 1}$ : 2-wire control: reverse operation. Refer to the 2-wire operation mode in Figure 4.3.1.

03-0X =02: Multi-speed setting command 1.
$03-0 X=03$ : Multi-speed setting command 2.

03-0X $=04$ : Multi-speed setting command 3.
$03-0 X=05$ : Multi-speed setting command 4.
03-0X $=29$ : Jog frequency selection (setting $=29$ ).
Select frequency reference using the multi-function digital input.

Table 4.4.5 Multi-speed operation selection

| Speed | Multi-function digital input (S1 ~ S6) |  |  |  |  | Frequency selection |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Jog <br> frequency reference | Multi-speed frequency 4 | Multi-speed frequency 3 | Multi-speed frequency 2 | Multi-speed frequency 1 |  |
| 1 | 0 | 0 | 0 | 0 | 0 | Frequency command 0 ( 05-01) or main speed frequency* ${ }^{*}$ |
| 2 | 0 | 0 | 0 | 0 | 1 | (04-05=0) Auxiliary speed frequency or (04-05 $\ddagger 0$ ) Frequency command 1 (05-02) *3 |
| 3 | 0 | 0 | 0 | 1 | 0 | Frequency command 2 (05-03) |
| 4 | 0 | 0 | 0 | 1 | 1 | Frequency command 3 (05-04) |
| 5 | 0 | 0 | 1 | 0 | 0 | Frequency command 4 (05-05) |
| 6 | 0 | 0 | 1 | 0 | 1 | Frequency command 5 (05-06) |
| 7 | 0 | 0 | 1 | 1 | 0 | Frequency command 6 (05-07) |
| 8 | 0 | 0 | 1 | 1 | 1 | Frequency command 7 (05-08) |
| 9 | 0 | 1 | 0 | 0 | 0 | Frequency command 8 (05-09) |
| 10 | 0 | 1 | 0 | 0 | 1 | Frequency command 9 (05-10) |
| 11 | 0 | 1 | 0 | 1 | 0 | Frequency command 10 (05-11) |
| 12 | 0 | 1 | 0 | 1 | 1 | Frequency command 11 (05-12) |
| 13 | 0 | 1 | 1 | 0 | 0 | Frequency command 12 (05-13) |
| 14 | 0 | 1 | 1 | 0 | 1 | Frequency command 13 (05-14) |
| 15 | 0 | 1 | 1 | 1 | 0 | Frequency command 14 (05-15) |
| 16 | 0 | 1 | 1 | 1 | 1 | Frequency command 15 (05-16) |
| 17 | $1{ }^{* 1}$ | - | - | - | - | Jog frequency command (00-18) |

## 0: OFF, 1: ON, -: Ignore

*1. Jog frequency terminal has a higher priority than multi-speed reference 1 to 4 .
*2. When parameter 00-05=0 (frequency reference input = digital operator), multi-speed frequency 1 will be set by 05-01 frequency reference setting1). When parameter 00-05=1 (frequency reference input=control circuit terminal), multi-speed frequency command 1 is input through analog command terminal Al1 or AI2.
*3. 05-02 is used for auxiliary speed frequency of Al 2 as default setting. It is necessary to set $04-05 \neq 0$ to switch 05-02 to be for Frequency command 1. When PID control mode is enabled (10-03= xxx1b), Frequency of Speed - Stage 1 can not switch auxiliary speed frequency even though Multi-function Terminal Function Setting (03-00~03-05)=16 (PID control disable).

Wiring Example: Fig. 4.4.14 and 4.4.15 show an example of a 9-speed operation selection.

Figure 4.4.14 Control Terminal Wiring Example

Figure 4.4.15 9-speed timing diagram
*1. When $00-05=1$, multi-speed frequency reference is set by analog input Al1 or Al2.

03-0X =06: Forward jog run command, uses jog frequency parameter 00-18.
03-0X =07: Reverse jog run command, uses jog frequency parameter 00-18.

## Notes:

- To excute the Forward jog or Reverse jog command need to set 00-02=1 at first.
- Jog command has a higher priority than other frequency reference commands.
- Jog command uses stop mode set in parameter 07-09 when Jog command is active $>500 \mathrm{~ms}$.
- When 11-00 (Direction Lock Selection) set to 1 (Only Allow Forward Rotation), if there is a motor reverse command, the "RUNER" warning will display.
- $\quad$ When 11-00 (Direction Lock Selection) set to 2 (Only Allow Reverse Rotation), if there is a motor forward command, the "RUNER" warning will display.
$\mathbf{0 3 - 0 X}=\mathbf{0 8}$ : UP frequency accelerating command; set parameter 00-05 Frequency command to 2 to activate.
$\mathbf{0 3 - 0 X}=\mathbf{0 9}$ : Down frequency decelerating command; set parameter 00-05 Frequency command to 2 to activate.

Note:

- The inverter operates the variation of increasing/ decreasing output frequency via keypad (refer to parameter 11-56) / external multi-function digital input (terminal S1to S6) when the motor is running.
- It is required to use two terminals to run UP/ DOWN command when the inverter runs this command via the external multi-function digital input terminal and 00-02=1 (external terminals) \& 00-05=2 (terminal command UP/DOWN) \& 03-00~03-05=8 (UP command)/ 9 (DOWN command).
- The inverter output frequency runs UP/ DOWN command with the setting of acceleration/ deceleration time.

Note: SE02 DI terminal Error will be displayed when:

- Only the UP or DOWN command function is set.
- Both UP command and Inhibit Acceleration/deceleration command are activated simultaneously.
- Both DOWN command and Inhibit Acceleration/deceleration command are activated simultaneously.

For the examples of UP/DOWN control wiring and operation, please refer to Figure 4.4.16 and 4.4.17.

| UP Command <br> (Terminal S5) | 1 | 0 | 0 | 1 |
| :--- | :---: | :---: | :---: | :---: |
| Down Command <br> (Terminal S6) | 0 | 1 | 0 | 1 |
| Operation | Accel <br> (UP) | Decel <br> (DWN) | Hold | Hold |

Figure 4.4.16 UP/DOWN wiring and operation example

Figure 4.4.17 Up / Down command timing diagram

## UP / DOWN Command Operation

When the Forward Run command is active and the UP or Down command is momentarily activated the inverter will accelerate the motor up to the lower limit of the frequency reference (00-13).

When using the UP / Down command, the output frequency is limited to the upper limit of frequency reference (00-12) and the lower limit of frequency reference (00-13).

The UP / DOWN command uses acceleration 1 or 2 / deceleration time 1 or 2 for normal operation Tacc1 / Tdec1 (00-14, 00-15) or Tacc2 / Tdec 2 (00-16, 00-17).

Refer to 03-40 UP/ DOWN frequency width setting for using other functions of UP/ DOWN. (It is enabled in inverter software V1.4)

Frequency reference retention is active when parameter $11-58$ is set to 1 and the frequency reference is saved when power is lost and retrieved when power is restored.
*1: When 11-58 = 1 and the operation command is active, the output frequency will accelerate to the previously stored frequency command.
*2: When 11-58 = 0 and the operation command is active, the output frequency will accelerate to the lower limit of frequency reference (00-13).
$03-0 X=10$ : Acceleration/deceleration 1 selection

## 03-0X =30: Acceleration/deceleration 2 selection

Refer to the "multi-function digital input terminals select acceleration/ deceleration time" in Table 4.4.1 and Figure 4.4.6.

03-0X =11: Acceleration/deceleration inhibition command (hold command)

When activated suspends the acceleration / deceleration operation and maintains the output frequency at current level.

If $11-58=1$, the frequency reference value is saved when the acceleration/deceleration inhibition command is active. Deactivating the acceleration / deceleration inhibition command resumes acceleration / deceleration.

If $11-58=1$, the frequency reference value is saved when the acceleration/deceleration inhibition command is active and even when powering down the inverter.

Refer to Fig.4.4.18. for an example.

Figure 4.4.18 Acceleration / deceleration inhibition command operation

[^2]*2. When $11-58=0$, and a run command is given and the acceleration / deceleration inhibit command is active, the frequency reference and output frequency will remain at zero.

## 03-0X =12: Main/Alternative Run command Switching

Run command source is set by alternative run command (00-03) when function terminal is active. When function terminal is set to 27 (Local/ Remote control selection), the priority will higher than the switch of main/ alternative run command.

## 03-0X =13: Main/Alternative Frequency Command Switching

Frequency command source is set by alternative frequency command (00-06) when function terminal is active. When function terminal is set to 27 (Local/ Remote control selection), the priority will higher than the switch of main/ alternative frequency command.

03-0X =14: Emergency stop (decelerate to zero and stop)
Refer to the "deceleration time of emergency stop" of parameter 00-26.
03-0X =15: External Baseblock Command (coast to stop)
Execute the base block command by the use of ON / OFF way of multi-function digital input terminal, and prohibit the inverter output.

During run: When an external base block command is activated, the keypad displays "BBn BaseBlock $(\mathrm{Sn})$ ", indicating the inverter output is turned off ( n indicates the digital input number $1-6$ ). Upon removing the base block signal, the motor will run at the frequency reference. If speed seach from frequency reference is active the inverter output frequency starts from the frequency reference and searches for the coasting motor speed and continue to operate. If speed search is not active the output frequency starts at 0 Hz .

During deceleration: When an external base block command is activated, the keypad displays "BBn BaseBlock (Sn)", indicating the inverter output is turned off ( $n$ indicates the digital input number $1-6$ ). Upon removing the base block signal, the motor is stopped or will coast to a stop and the inverter will remains in the stop condition.

During acceleration: When an external base block command is activated, the keypad displays "BBn BaseBlock ( Sn )", indicating the inverter output is turned off ( n indicates the digital input number $1-6$ ). Upon removing the base block signal, the motor will run at the frequency reference. If speed seach from frequency reference is active the inverter output frequency starts from the frequency reference and searches for the coasting motor speed and continue to operate. If speed search is not active the output frequency starts at 0 Hz .

Figure 4.4.19 External base block operation

03-0X =16: PID control disable.

Note: The frequency will depend on parameter 00-05 (reference frequency) to determine the source of frequency input. Refer to the descriptions of parameter 00-05 and 00-06 for details.

## 03-0X =17: Fault reset

The output becomes active when the inverter trips on a fault. Upon an inverter fault the inverter output will turn off (base block) and the keypad displays the dedicated fault message.

When fault occurs, the following actions can be used to reset the fault:

1. Program one of the multi-function digital inputs (03-00 to 03-05) to 17 (reset fault) and active input.*
2. Press the reset key of the digital operator (RESET).*
3. Recycle power to the inverter. Important Note: If a run command is active during power-up, the inverter will start running automatically.

* To reset an active fault the run command has to be removed.

03-0X =19: Speed Search 1 (from the maximum frequency).

03-0X =34: Speed Search 2 (from the frequency command).
Refer to the "speed search" function in the parameter group 7 (start/ stop control function).
03-0X =20: Energy saving enabled
Manual energy savings function is set with parameters 11-12 and 11-18.
For the manual energy saving operation refer to Figure 4.3.78.
03-0X =21: PID integral reset
03-0X $=25$ : External fault
Activating the external fault input will turn off the inverter output and the motor will coast to a stop. The keypad displays the external fault message "EFn Ext. Fault (Sn)", where n is the input terminal number.

03-0X $=27$ : Local / Remote selection.
Switch the inverter frequency reference source between Local (keypad) or Remote (control circuit terminals or RS485). Use parameter 00-05 (Main frequency command source selection) and 00-02 (Run command selection) to select the input source. When PID is enabled (10-03=XXX1), parameter 10-00 (target value source) is performed. If $23-00=1$, make sure the setting value of parameter 23-04. If $23-00=2$, make sure the setting value of parameter 23-59 and 00-02.

Note: In 3-wire operation terminal S1 and S2 are reserved for run/stop operation and the Local / Remote function can only be set to digital input terminals S3 to S6 (03-02 to 03-05).

Note: To switch between local and remote the inverter has to be stopped.

| Input | Mode | Frequency Reference / Run/Stop Command Source |
| :---: | :---: | :---: |
| ON | Local | - Frequency reference and Run-Stop from keypad. <br> - LEDs SEQ and REF are off. <br> - When PID is enabled, REF indicator OFF presents PID target value is set by the keypad. |
| OFF | Remote | - Frequency reference source selected by parameter 00-05 and Run-Stop source selected by parameter 00-02. <br> - LEDs SEQ and REF are on. <br> - When PID is enabled, REF indicator ON presents PID target value is set by the control terminal AI1. |

03-0X $=28$ : Remote mode selection
Switch between terminal source and communication (RS-422/RS-485) source for frequency reference and operation command.

In Remote mode, indicators of SEQ and REF are on; you can use terminals Al1 and AI2 to control the frequency command, and use terminals $\mathrm{S} 1, \mathrm{~S} 2$ or communication terminal $\mathrm{RS}-485$ to control the operation command.

| Input | Mode | Frequency Reference / Run/Stop Command Source |
| :---: | :---: | :--- |
| ON | Communication | -Frequency reference and run/stop command control via communication <br> (RS-422/RS-485). |
| OFF | Terminal | - Frequency reference source from Al1 / Al2 input (00-05=1) and <br> Run-Stop command from terminals S1 / S2 (00-02=1). |

Figure 4.4.20 Remote mode operation selection
To switch the frequency reference and operation command input between communication RS-485 and control terminals the following parameters have to be set:

1. $00-05=1$ (use control terminal Al 1 or Al 2 as reference frequency source)
2. $00-02=1$ (use control terminal S 1 or S 2 for operation command)
3. Set one of the digital input terminals (03-02 to 03-05) to 28 (Operation selection of remote mode)

03-0X =24: PLC Input
It is required to match Drive Link program. Ladder diagram is edited in the PLC program. When the message output is conducted, this message will be sent to the inverter.

03-0X =26: 3-Wire Sequence (Forward/Reverse Command)
When the digital input terminals (S3~S6) is set to 26 , terminal S 1 and S 2 will become the run command and stop command. Refer to Fig.4.4.2.

03-0X =29: Jog Frequency Selection
When 00-18 (Jog Frequency) is set up, the inverter depends on this frequency for command when it is ON.

## 03-0X =30: Acceleration/ Deceleration Setting Command 2

When it is ON, the inverter will be active depends on the acceleration time 2 of 00-16 and deceleration time 2 of 00-17.

03-0X =31: Inverter overheat warning

When input is active the inverter displays warning message "OH2" and continues operation. Deactivating the input reverts back to the original display. Warning message does not require resetting the inverter.

03-0X =33: DC braking
When input is active DC-Injection braking is enabled during start and stopping of the inverter.
DC Injection braking is disabled when a run or jog command is active.
Note: Either short-circuits braking command or DC braking command is selected. If these two modes are both selected, SE02 error (DI Terminal Error) will occur.

Refer to the DC braking time diagram in Fig.4.4.21.

Figure 4.4.21 DC braking timing diagram
03-0X $=35$ : Timing function
Refer to the "time function" parameter 03-37 and 03-38.

## 03-0X =36: PID Soft start disable

Refer to the "PID Control" function of PID function parameter group 10.
03-0X =47: Fire mode (Foreced to operation mode)
When input is active disables all inverter warning and hardware (exclusive of SC) protections. This function is commonly used in commercial applications where the inverter controls an exhaust fan and needs run to destruction in case of a fire.

03-0X =48: KEB acceleration
When input is active enables KEB (Kinetic Energy Braking) during acceleration. Refer to the parameter description of 11-47 and 11-48. Note: To enable set parameter 11-47 to a value greater than 0 .

03-0X =49: Parameters write-in allowed
When input is active allows parameter to be changed.
Note: When none of the digital input terminals are set to function 49, parameter write-in protection is controlled by parameter 13-06.

| Input | Parameter Save |
| :---: | :---: |
| ON | Parameters Write Enabled |
| OFF | Parameters Write Protected |

When input is active prevents inverter from starting automatically when a run command is present at time of power-up. Please refer to Fig.4.4.21a for more details.

Figure 4.4.21a Unattended Start Protection
03-0X =53: 2-Wire Self Holding Mode (Stop Command).
Refer to the "2-wire operation with hold function" of parameter 00-02.
03-0X =54: Switch PID1 and PID2
It will switch PID1 to PID2 when PID2 is ON.

## 03-0X =55: RTC Time Enable

When 16-13 (RTC timer function) $=2$ (DI setting) and RTC Time Enable is ON, RTC timer function is enabled.

## 03-0X =56: RTC Offset Enable

When 16-30 (Selection of RTC Offset) $=2$ (DI setting) and RTC Offset Enable is ON, the inverter will run depending on RTC offset time setting (16-31).

03-0X =57: Forced Frequency Run
This function enables with the corresponding of parameter of 23-28 and the source of frequency command of parameter 00-05 set to the value of 5 (PID given, namely the parameter of10-03 needs to be active).

When any one of the multi-function digital input terminal (S1~S6) is set to the value of 16 (the interdiction of PID function), pump will not depend on feedback to do any PID output adjustment; simultaneously another one is set to the value of 57 (forced frequency run) and inverter will have the frequency run setting depending on the parameter of 23-28. Inverter will stop output when digital input terminals (S1~S6) are removed.

This function is applied to inverter output being controlled by external pressure sensor (eg. differential pressure switch) when pressure sensor disconnects.

## 03-0X =58: Run Permissive Function

When digital input terminal enables, inverter will stop via the set of parameter 08-30 after Run Permissive Function function is active.

03－0X＝63：Switch to Tolerance Range of Constant Pressure 2
When using in PUMP mode（23－00＝1），the tolerance range of constant pressure（23－09）will be used for waking up the inverter．When digital input terminal enables，the tolerance range of constant pressure 2 （23－34）will be used．

03－0X $=65$ ：Short－circuit breaking
To stop inverter by turning on Short－circuit breaking with setting terminal．If executing run command or jog command，short－circuit breaking command will erased and start to run．The following picture is short－circuit breaking time process．

Note：Either short－circuits braking command or DC braking command is selected．If these two modes are both selected，SE02 error（DI Terminal Error）will occur．

## 03－0X＝68：External Fault 2

－When an external fault occurs，the external fault 2 input terminal is turned on，the inverter will be turned off and the motor will free run to stop．
－If external input terminal S3 is set $(03-02=68)$ as external fault，the message＂EF3 Ext．Fault $(S 3)$＂ （EF3）will be displayed．
－All six input terminals（S1 to S 6 ）can be designated as external fault input．
03－0X＝69：External Overload，Input Terminal is Normally Closed Switch．
－When external overload occurs，the external overload input terminal closed，the inverter will be turned off and the motor will decelerate to stop．
－If the external input terminal S5 is set $(03-04=69)$ to external overload，＂TOL Ext．OverLoad＂message will be displayed．
－To enable the external overload function，the fire mode must be enabled first（08－48＝1），only the external input terminal S5 can be designated as External Overload Input．
－Setting the external input terminal as External Overload will set the input terminal as the normally closed，therefore，before setting the external overload function，do not set the operation command from the external terminal，otherwise，it will cause unnecessary damage．

| $03-08$ | （S1～S6）DI Scan Time |  |
| :--- | :--- | :--- |
| Range | $【 0 】$ | Scan Time 4ms |
|  | $【 1 】$ | Scan Time 8ms |

Set the digital input CPU scan time．The digital input signal needs to be present for the minimum scan time to qualify as an enabled command．

Note：For noisy environments select scan time of 8 ms （results in a slower response time）．

| $03-10$ | Multi－function Terminal S5－S6 Type Selection |
| :---: | :--- |
| Range | 【xxx0b】：S5 A contact |
|  | 【xxx1b】：S5 B contact |
|  | 【xx0】 $:$ S6 A contact |

Parameter 03－09 and 03－10 selects the digital input type between a normally open and a normally closed switch／contact．

$$
\begin{aligned}
& \text { Each bit of 03-09/03-10 presents an input : } \\
& \text { 03-09= } \begin{array}{llllll}
\underline{0} & \underline{0} & \underline{0} & \underline{0} & \underline{0} \text { : normally open switch } \\
\text { s4 } & \text { s3 } & \underline{\text { s2 }} & \underline{\text { s1 }} & 1: \text { normally closed switch } \\
03-10= & \underline{x} & \underline{x} & \underline{0} & \underline{0} & \underline{0} \text { : normally open switch } \\
& & & \mathrm{s} 6 & \mathrm{~s} 5 & 1: \text { normally closed switch }
\end{array}
\end{aligned}
$$

Example：S1 and S2 wired to a normally closed contact／switch set 03－09＝0011．
Do not set the operation command parameter 00－02 to terminal control before setting the digital input type．Failure to comply may cause death or serious injury．

03-1X=0: During Running

| OFF | Run command is OFF and the inverter is stopped. |
| :---: | :--- |
| ON | Run command is ON or output frequency is greater than 0. |

$03-1 \mathrm{X}=1$ : Fault contact output
Output is active during fault condition.
Note: Communication error (CF00, CF01) do not activate the fault contact.
03-1X=2: Frequency Agree
Output is active when the output frequency falls within the frequency reference minus the frequency detection width (03-14).

## 03-1X=3: Setting Frequency Agree

Output is active when the output frequency falls within the frequency detection width (03-14) of the set frequency detection level (03-13).
$03-1 X=4$ : Frequency detected 1
Output is active when the output frequency rises above the frequency detection level (03-13) + frequency detection width (o3-14) and deactivates when the output frequency falls below frequency detection level (o3-13).
$03-1 X=5$ : Frequency detected 2
Output is active when the output frequency is below the frequency detection level (03-13) + frequency detection width (03-14) and turns off when the output frequency falls below frequency detection level.

Refer to parameter group 03 for frequency detection function.
$03-1 X=6$ : Automatic restart.
Output is active during an auto-restart operation.
03-1X=9: Baseblock (B.B.)
Output is active when the inverter output is turned off during a Baseblock command.
03-1X=12: Over torque detected (Normally Open)
Output is active during an over torque detection see parameters 08-13 $\sim 08-16$.
03-1X=25: Low torque detected (Normally Open)
Output is active during low torque detection see parameters 08-17~08-20.
$03-1 \mathrm{X}=13$ : Current Agree
When the output current is larger than that in 03-15 and its duration is higher than that in 03-16, this function will be ON.

03-1X=18: PLC status ( setting =18)
Output is active when operation command parameter (00-02) is set to 3: PLC Control.
03-1X=19: PLC control contact
Output is controlled by the PLC logic
03-1X=20: Zero-speed
Output is active during zero-speed

| Active | Output frequency >=minimum output frequency (01-08, Fmin) |
| :---: | :--- |
| Off | Output frequency is <=the minimum output frequency |

Figure 4.4.23 Zero-speed operation

## 03-1X=21: Inverter Ready

Output is active when no faults are active and the inverter is ready for operation.

## $\mathbf{0 3 - 1 X}=\mathbf{2 2}$ : Undervoltage Detection

Output is active when the DC bus voltage falls below the low voltage detection level (07-13).
03-1X=23: Source of operation command
Output is active in local operation command.

| OFF | Remote mode: $00-02=1$ or 2 , or any one of the multi-function digital input terminals (S1 to S6) set to function 5 (LOCAL / REMOTE control) is OFF. <br> SEQ LED of the keypad is ON. |
| :---: | :---: |
| ON | Local mode: 00-02 $=0$, or any one of the multi-function digital input terminals (S1 to S6) set to function 5 (LOCAL / REMOTE control) is active. <br> SEQ LED of the keypad is OFF. |

$\mathbf{0 3 - 1 X}=24$ : Source of frequency command
Output is active in local frequency command.

| OFF | Remote mode: <br> $00-05=1$ or 2 , or any one of the multi-function digital input terminals (S1 to S6) set to <br> function 5 (LOCAL / REMOTE control) is OFF. <br> REF LED of the keypad is ON. |
| :--- | :--- |
| ON | Local mode: <br> $00-05=0$, or any one of the multi-function digital input terminals (S1 to S6) set to <br> function 5 (LOCAL / REMOTE control) is active. <br>  <br> REF LED of the keypad is OFF. |

03-1X=26: Frequency reference missing
Output is active when the frequency reference is lost. When parameter $11-41$ is set to 0 the inverter will decelerate to a stop. When parameter $11-41$ is set to 1 operation will continue at the value of parameter 11-42 times the last know frequency reference.
$03-1 X=27$ : Time function output

Output is controlled by timer function see parameter 03-37 and 03-38.

03－1X＝32：Communication control contacts

Output is active when communication control is active．

## 03－1X＝37：Detection Output of PID Feedback Loss

When PID feedback loss occurs（refer to parameters setting 10－11～10－13），this function will be ON．
03－1X＝38：Brake Release

When this function is ON，Break release is enabled．Refer to parameters descriptions of 03－41～03－42．

## 03－1X＝42：Over－High Pressure

Refer to the setting of parameters 23－12～23－14 for the warning／fault．

## 03－1X＝43：Over－Low Pressure

Refer to the setting of parameters 23－15～23－17 for the warning／fault．
03－1X＝44：Loss of Pressure Detection
Refer to the setting of parameters 23－18～23－19 for the warning／fault．

## 03－1X＝45：PID Sleep

PID sleep will be informed．
03－1X＝46：Over－High Flow
Refer to the setting of parameters 23－48～23－50 for the warning／fault．
03－1X＝47：Over－Low Flow
Refer to the setting of parameters 23－51～23－53 for the warning／fault．
$03-1 X=48$ ：Shortage of Low Suction
Refer to the setting of parameters 23－54～23－58 for the warning／fault．
03－1X＝49：RS－485 communication error
When RS－485 communication error，the output terminal is closed，please refer to the description of 09－06～09－07．

03－1X＝54：Turn on short－circuit braking
Output terminal is closed when Turning on short－circuit braking
03－1X＝57：Low Current Detection
When output current $\leqq 03-48$ ，the relay is active．
03－1X＝58：Frequency Deceleration Detection
When output frequency＜frequency command－03－14 in deceleration，the relay is active．
03－1X＝59：Over Temperature Detection
The Heat Sink Temperature $>08-46$ ，the relay is active，the Magnetic Hysteresis Zone is set by 08－47．

| $03-13$ | Frequency Detection Level |
| :---: | :--- |
| Range | $【 0.0 \sim 599.0 】 \mathrm{~Hz}$ |
| $03-14$ | Frequency Detection Width |
| Range | $【 0.1 \sim 25.5 】 \mathrm{~Hz}$ |
| $03-44$ | Frequency Detection Level 2 |

| Range | 【0．0～599．0】 Hz |
| :---: | :--- |
| $03-45$ | Frequency Detection Width 2 |
| Range | $【 0.1 \sim 25.5 】 \mathrm{~Hz}$ |
| $03-46$ | Frequency Detection Level 3 |
| Range | $【 0.0 \sim 599.0 】 \mathrm{~Hz}$ |
| $03-47$ | Frequency Detection Width 3 |
| Range | 【0．1～25．5】 Hz |
| $03-50$ | Frequency Detection Level 4 |
| Range | $【 0.0 \sim 599.0 】 \mathrm{~Hz}$ |
| $03-51$ | Frequency Detection Level 5 |
| Range | 【0．0～599．0】 Hz |
| $03-52$ | Frequency Detection Level 6 |
| Range | $【 0.0 \sim 599.0 】 \mathrm{~Hz}$ |

Frequency Detection Level：set the multi－function output terminals R1A－R1C，R2A－R2C or R3A－R3C （03－11，03－12 or 03－39）to the output frequency detection signal．Set frequency and output frequency detection 1 and 2.

The time charts for the Frequency Agree Detection operation are shown in the following Table 4．4．7．
Table 4．4．7 Frequency Detection Operation

| $03-15$ | Current Agree Level |
| :---: | :--- |
| Range | $【 0.1 \sim 999.9 】 \mathbf{A}$ |
| $03-16$ | Delay Time of Current Agree Detection |
| Range | $【 0.1 \sim 10.0 】$ Sec |
| $03-53$ | Current Agree Level 2 |
| Range | $【 0.0 \sim 999.9 】 A$ |

Note：The Maximum Value of 03－53 will be limited by Setting Value of 03－15
$>03-11=13$ ：Relay is active when output current is larger than that in 03－15．
$>$ 03－15：The suggested setting value is $0.1 \sim$ the motor rated current．
$>03-16$ ：The unit of the setting value $(0.1 \sim 10.0)$ is second．In addition，when the Output Current is $\leq$ $03-53$ ，the delay time of relay signal from ON to OFF is 100 ms （constant）．

Timing Diagram：

| $03-48$ | Low Current Detection Level |
| :---: | :--- |
| Range | 【0．1～999．9】 A |
| $03-49$ | Low current Detection Delay Time |
| Range | 【0．00～655．34】 Sec |

$>$ 03－11＝57：Relay is active when output current is lower than that in 03－48．
$>$ 03－48：Setting value：0．1～999．9；when it is 0.0 ，function of low current detection is disabled．
$>$ 03－49：Setting value：0．00～655．35（unit：sec）；when the current is continuously lower than the setted value of parameter 03－48 within the setted time of parameter 03－49，the relay is enabled．The delay time of relay signal from ON to OFF is 100 ms （constant）．

Timing Diagram:

| $03-17$ | Setting of Mechanical Brake Release Level |
| :---: | :--- |
| Range | $0.00 \sim 599.00 \mathrm{~Hz}$ |
| $03-18$ | Setting of Mechanical Brake Operation Level |
| Range | $0.00 \sim 599.00 \mathrm{~Hz}$ |

When 03-11=14,

Relay output starts at acceleration if the output frequency reaches the mechanical brake release level (03-17).
Relay output stops at deceleration if the output frequency reaches the mechanical brake operation level (03-18).

When 03-17 $\leq 03-18$, timing diagram is as follows:

When $\mathbf{0 3 - 1 7} \geq \mathbf{0 3 - 1 8}$ ，timing diagram is as follows：

＊1：The parameters are available when the I／O expansion card installed．

Parameter 03－19 selects the digital output type between a normally open and a normally closed contact． Each bit of 03－19 presents an output ：

$$
\begin{array}{lllll}
03-19= & \underline{0} & \underline{0} & \underline{0} & \begin{array}{l}
\text { 0: normally open contact } \\
\\
\end{array} \begin{array}{ll}
\text { R3 } & \text { R2 }
\end{array} \\
\text { R1 } & \text { 1: normally close contact }
\end{array}
$$

Example：R1 normally closed and R2 normally open contact set $03-19=x 001 b$ ．

| $03-27$ | UP／DOWN Frequency Hold／Adjust Selection |
| :---: | :--- |
| Range | 【0】：Keep UP／DOWN frequency when stopping． |
|  | 【1】：Clear UP／DOWN frequency when stopping． |
|  | 【2】：Allow frequency UP／DOWN when stopping． |
|  | 【3】：Refresh frequency at acceleration． |

$\mathbf{0 3 - 2 7}=0$ ：When the run command is removed the UP／DOWN frequency reference before deceleration is stored．The next time the run command is applied the output frequency will ramp up to the previously stored frequency reference．

03－27＝1：When the run command is removed the UP／DOWN frequency reference command is cleared（set to 0 ）．The next time the run command is applied the output frequency will start at 0 ．

03－27＝2：UP／DOWN command is active when run command is not active．

03－27＝3：Keep the state of frequency command not to be cleared．When Run Command re－sends，press UP／DOWN key before the run frequency reaches the frequency command，press UP／DOWN key，then：
－When 03－40＝0，Frequency Command is set by Run Frequency．
－When $03-40 \neq 0$ ，Frequency Command is set by the values of Run Frequency plus the setting frequency of 03－40．

| $\mathbf{0 3 - 3 0}$ | Pulse Input Selection |
| :--- | :--- |
| Range | 【0】：Common Pulse Input |
|  | 【1】：PWM（Pulse Width Modulation） |

＊1：It is new added in inverter software V1．4．

There are two modes in pulse input selection：

## 03－30＝0：Common Pulse Input

Pulse Input $(\mathrm{PI})=$ the selected frequency divided by pulse input scaling（set by 03－31），corresponding to the maximum output frequency of motor 1 （01－02）．

Note：Monitor parameter 12－79（pulse input percentage）displays the proportional relationship between input signal and 03－31（pulse input scaling）．

## 03－30＝1：PWM（Pulse Width Modulation）

It is required to input the correct frequency．
PWM＝posedge pulse time divided by previous pulse time period，corresponding to the maximum output frequency of motor 1 （01－02）．

Note：Monitor parameter 12－79（pulse input percentage）displays the proportional relationship between the positive edge of input signal and time period．

Note：Tolerance range of pulse time period in PWM modes is $\pm 12.5 \%$ ．If it is over than the range，it is inactive．

## Diagram of pulse input selection：

| 03－31 | Pulse Input Scaling |
| :---: | :--- |
| Range | $【 50 \sim 32000 】 \mathrm{~Hz}$ |

Pulse input scaling，100\％＝Maximum pulse frequency．

| 03－32 | Pulse Input Gain |
| :--- | :--- |
| Range | $【 0.0 \sim 1000.0 】 \%$ |

Target value（03－03）in \％＝Pulse input frequency scaled to $100 \%$ based on maximum pulse frequency （03－31）times the gain（03－32）＋bias（03－33）．

| $03-33$ | Pulse Input Bias |
| :---: | :--- |
| Range | $【-100.0 \sim 100.0 】 \%$ |

Target value（03－03）in \％＝Pulse input frequency scaled to $100 \%$ based on maximum pulse frequency （03－31）times the gain（03－32）＋bias（03－33）．

| $03-34$ | Pulse Input Filter Time |
| :---: | :--- |
| Range | $【 0.00 \sim 2.00 】$ Sec |

＊Refer to Fig．4．4．24 for the pulse input specification．

Figure 4．4．24 Pulse input adjustment

## Set Pulse Input Setup as Flow Meters Input

Set parameter 23－45（Given Modes of Flow Meters Feedback）to 2 （Pulse Input）to use the pulse input terminal Pl as the flow meters input．Refer to the description of parameter group 23 for details．Next set the pulse input scaling（03－31），enter the pulse input frequency to match the maximum output frequency． Adjust the pulse input filter time（03－34）in case interference or noise is encountered．

| $03-37$ | Timer ON Delay（DI／DO） |
| :---: | :--- |
| Range | $【 0.0 \sim 6000.0 】$ Sec |
| $03-38$ | Timer OFF Delay（DI／DO） |
| Range | $【 0.0 \sim 6000.0 】 \mathrm{Sec}$ |

Enable the timer function be setting one of multi－function input parameters 03－00～03－05（S1 to S6）to 35 （timer function input）and one of multi－function output parameters 03－11，03－12，03－39（R1A－R1C to R3A－ R3C）to 27 （timer function output）．

The timer function can be used to implement a timer relay．Use timing parameter 03－37 and 03－38 to set the timer ON／OFF delay．

Timer output is turned ON when the multi－function timer input is ON for the time specified in parameter 03－37．

Timer output is turned OFF after the multi－function timer input is OFF for the time specified in parameter 03－38．

## Timing example：

| $03-40$ | Up／down Frequency Width Setting |
| :---: | :--- |$\quad$＊1

＊1：It is new added in inverter software V1．4．

For example：Set terminal S1：03－00＝【 8 ］（Up Frequency Increasing Command），S2：03－01＝［9］（DOWN Frequency Decreasing Command）and 03－40＝【 $\triangle$ 】 Hz．

Mode1：When $03-40$ is set to 0 Hz ，it will maintain the original up／down function，shown as Fig．4．4．20． Mode2：When $03-40$ is not set to 0 Hz and terminal conduction time is lower than 2 sec ，conducting one time leading to frequency variation $\triangle \mathrm{Hz}$（setting frequency by 03－40）。

Mode3: When $03-40$ is not set to 0 Hz and terminal conduction time is larger than 2 sec , frequency variation depends on acceleration/ deceleration.

## Notes:

$\triangle \mathrm{H} 1$ : setting frequency increment in acceleration, t 1 : terminal conduction time in acceleration, $\triangle \mathrm{H} 2$ : setting frequency increment in deceleration, t : terminal conduction time in deceleration.
$\Delta H 1=\frac{\text { Upper Limit Frequency }}{\text { Accelerati on Time } 2} \times$ Terminal Conduction Time (t1)
$\Delta H 2=\frac{\text { Upper Limit Frequency }}{\text { Decelerati on Time } 2} \times$ Terminal Conduction Time (t2)

| $03-41$ | Torque Detection Level | $* 1$ |
| :---: | :--- | :--- |
| Range | $【 0 \sim 150 】 \%$ | $* 1$ |
| $03-42$ | Delay Time of Braking Action |  |
| Range | $【 0.00 \sim 65.00 】$ Sec |  |

＊1：It is new added in inverter software V1．4．

## Function of Brake Release：

It requires function of frquecny agree to use，shown as the following figure．

When output frequency is larger than frequency detection level（03－13）and output torque is larger than torque detection level（03－41）during Inverter operation，it will delay braking action delay time（03－42）and then release brake．

It is also recommended to be with the use of start and stop frequency locked function（11－43～11－46）， shown as the following figure：

| $03-43$ | UP／DOWN Acceleration／Deceleration Selection |
| :---: | :---: |
| Range | 【0】：Acceleration／Deceleration Time 1 |
|  | $【 1 】:$ Acceleration／Deceleration Time 2 |

Calculate the acceleration／deceleration time of frequency command by switch the function of UP／DOWN from parameter 03－43．Ex：$\Delta \mathrm{H} 1$（set frequency increment at acceleration）and $\Delta \mathrm{H} 2$（set frequency increment at deceleration）．

＊1：The parameters are available when the I／O expansion card installed．
For Standard H \＆C type：
Refer to the followings for the details of parameter 04－00（Al input signal type）
$\mathrm{Al} 2=0 \sim 10 \mathrm{~V}$ ，Set $04-00=0$ ，tune SW2 on the control board ro V ．
Al2 $=0 \sim 20 \mathrm{~mA}$ ，Set $04-00=0$ ，tune SW2 on the control board to I ．
Al2 $=4 \sim 20 \mathrm{~mA}$ ，Set $04-00=1$ ，tune SW2 on the control board to $I$ ．
AI2＝2～10V，Set 04－00＝1，tune SW2 on the control board to V．
For Enhanced E \＆G type：
Refer to the followings for the details of parameter 04－00（Al input signal type）
AI1 $=0 \sim 10 \mathrm{~V}$ ，Set $04-00=0$ or 1 ，tune SW3 on the control board to V ．
AI1 $=4 \sim 20 \mathrm{~mA}$ ，Set $04-00=4$ or 5 ，tune SW3 on the control board to I．
Al2 $=0 \sim 10 \mathrm{~V}$ ，Set $04-00=0$ or 2 or 4 ，tune SW4 on the control board to V
Al2＝4～20mA，Set $04-00=1$ or 3 or 5 ，tune SW4 on the control board to I．
For I／O expansion card：
Refer to the followings for the details of parameter 04－09（Al input signal type）
$\mathrm{Al} 3=0 \sim 10 \mathrm{~V}$ ，Set $04-09=0$ ，tune SW7 on the I／O expansion card to V．
$\mathrm{Al} 3=-10 \sim 10 \mathrm{~V}$ ，Set 04－09＝1，tune SW7 on the I／O expansion card to V ．
$A I 3=4 \sim 20 \mathrm{~mA}$ ，Set $04-09=2$ ，tune SW7 on the I／O expansion card to $I$ ．
（1）Analog Input Level Adjustment Al1，Al2，Al3（04－02，04－03，04－04，04－07，04－08，04－22，04－23）
Each analog input Al1and AI2 has a separate gain and bias parameter associated with it．
Analog input signal Al1 can be adjusted with parameter 04－02 and 04－03；Analog input signal Al2 can be adjusted with parameter 04－07 and 04－08，Analog input signal AI3 can be adjusted with parameter 04－22 and 04－23．Refer to Fig．4．4．25．

Figure 4．4．25 Analog inputs and related parameters（For Standard H \＆C type）

Gain setting：Sets the level in \％that corresponds to a 10 V or 20 mA signal at the analog input．

Bias setting：Sets the level in \％that corresponds to a OV or 4mA signal at the analog input．

Use both gain and bias setting to scale the input signal．

Figure 4.4.26 Gain and bias operations (for frequency reference signal)

## 04-04 (Al negative characteristics)

Through the following figure negative characteristics diagram find out the AI Input $10 \mathrm{~V},-10 \mathrm{~V}$, or 20 mA input relative frequency reference to be used for the ratio of maximum output frequency (set the maximum output frequency 01-02 to 100\%), the ratio will be presented in reverse.

(1) Al1 signal filtering time (04-01)
(2) Al2 signal filtering time (04-06)
(3) Al3 signal filtering time (04-21)

All analog inputs (AI1, $\mathrm{Al} 2, \mathrm{Al} 3$ ) have a $1^{\text {st }}$ order programmable input filter that can be adjusted when noise is present on each of the incoming analog signal to prevent erratic drive control.

The filter time constant (range: 0.00 to 2.00 seconds) is defined as the time that the input step signal reaches $63 \%$ of its final value.

Note: Increasing the filter time causes the drive operation to become more stable but less responsive to change to the analog input.

Figure 4.4.27 Filter time constant

## (4) Al2 function setting (04-05/04-10)

Al2 is multi-function analog input terminal function selection. Refer to Table 4.4.8 for function overview

Table 4.4.8 Multi-function analog input list (04-05/04-10 setting)

| Value | Function |  | Description | Control mode |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Name | LCD Display |  | V/F | SLV | PLV |

| 17 | Reserved | No Function | Reserved | 0 | 0 | 0 |

Note: When the setting of AI2 and AI3 are the same, use AI2 signal only.

04-05=0: Auxiliary frequency
When parameter 00-05 = 1 (main frequency from external control) the auxiliary speed reference frequency can be activated via the multi-speed input commands (see table 4.4.5). The auxiliary frequency command can be set via AI2/AI3. The maximum output frequency is set by 01-02, Fmax $=100 \%$.

## 04-05/04-10=1: Frequency Reference Gain (FGAIN)

Multi-function analog input AI2/AI3 can be used to adjust the frequency reference gain of analog input Al1. The total frequency reference gain of terminal Al1 is the internal gain set by parameter 04-02 times FGAIN. The maximum frequency reference for Al1 is $100 \%$.

Figure 4.4.28 Frequency gain adjustment

## Example:

When the internal gain of $\mathrm{Al} 1(04-02)$ is set to $100 \%$ and Al 2 to 5 V (for example FGAIN $=50 \%$ ), the reference frequency of terminal Al1 will be 50\%, as shown in Fig. 4.4.29.

Figure 4.4.29 Frequency reference gain adjustment (example)
04-05/04-10=2: Frequency Reference bias (FBIAS)
Multi-function analog input terminal Al2 can be used to adjust the frequency reference bias of Al1.
The total frequency reference bias of terminal Al1 is the sum of internal bias set by parameter 04-03 and FBIAS. The maximum frequency reference for Al 1 is $100 \%$.

Figure 4.4.30 Bias adjustment

## Example:

Terminal Al1 input is $0 \mathrm{~V}, 04-02=100 \%$ (Al1 gain), 04-03 $=0 \%$ (Al1 bias) and terminal Al 2 input is 3 V . The reference frequency will be $30 \%$ as shown in Fig.4.4.31.

Figure 4.4.31 Frequency Reference bias adjustment (example)

## 04-05/04-10=3: Output Voltage Bias (VBIAS)

Multi-function analog input AI2/AI3 can be used to adjust the output voltage. The total output voltage of inverter is the sum of output voltage based on the selected V/F curve ( $01-00=\mathrm{F}$ ) and VBIAS.
The maximum output voltage will be limited by $01-03, \mathrm{Vmax}=100 \%$

Figure 4.4.32 Bias adjustment

04-05/04-10=4: Acceleration and deceleration coefficient (K)
Multi-function analog input AI2/AI3 can be used to adjust the acceleration and deceleration time coefficient. The actual acceleration and deceleration time is calculated as follows:

Actual accel $/$ decel time $=$

K
Acceleration/ Deceleration time setting is $100 \%$ (00-14~00-17, 00-21~00-24).

Figure 4.4.33 Acceleration / deceleration time reduction coefficient
04-05/04-10=5: DC braking current
Multi-function analog input AI2/AI3 can be used to adjust the DC Injection braking current. DC braking current parameter 07-07 setting should be set to $0 \%$ to use this function. The inverter rated current $=100 \%$

Note: When using the permanent magnet (PM) motor, there will be no options of setting 5 .

Figure 4.4.34 DC braking current adjustment

04-05/04-10=6: Over-torque detection level
Multi-function analog input AI2/Al3 can be used to adjust the over-torque detection level.
$100 \%$ of inverter rated current (V/F control mode)
$100 \%$ motor rated torque (SLV control mode)
If the multi-function analog input is used to adjust the over-torque level, the internal over-torque detection level (08-15) is disabled.

Figure 4.4.35 Over-torque/less torque detection level adjustment
4-05/04-10=7: Stall prevention level during running
Multi-function analog input AI2/AI3 can be used to adjust the stall prevention level during operation. Inverter rated current $=100 \%$. When AI2 is set to control stall prevention level $(04-05=7)$ or AI3 is set to control stall prevention level $(04-10=7)$ and parameter 08-03 (Stall prevention level during operation) is used, then the lesser of the two value becomes the active stall prevention level during operation.

Example: If the motor power is less than that of the inverter, the operation and the stall prevention of the motor will be based on the factory settings, multi-function analog input AI2/AI3 can be used to reduce the stall prevention level during operation.

Figure 4.4.36 Stall prevention level adjustment during operation
04-05/04-10=8: Frequency lower limit
Multi-function analog input AI2/AI3 can be used to adjust the lower limit of frequency reference.
Maximum output frequency (Fmax, 01-02) $=100 \%$. The actual lower limit is determined by the maximum value of 00-13 (frequency lower limit) and level of the multi-function analog input AI2/AI3.

Figure 4.4.37 Adjustment of lower limit of frequency reference

04-05/04-10=9: Jump frequency 4
Multi-function analog input AI2/AI3 can be used to adjust Jump frequency 4.
Maximum output frequency $(01-02$, Fmax $)=100 \%$. Setting 11-08 $\sim 11-10$ to 0.0 Hz turns of the Jump frequency function.

Figure 4.4.38 Jump frequency 4 setting operation

## 04-05=10 or 04-10=10: Added to Al1

Multi-function analog input AI2/AI3 can be used as a bias level for analog input Al1.

Figure 4.4.39 Added to Al1 as a bias operation

## Example:

04-02 (Al1 gain) $=100 \%, 04-03(\mathrm{Al} 2$ gain $)=0 \%$, and terminal Al 2 level is 2 V . If input terminal Al 1 is 0 V , the internal reference frequency of terminal Al1 will be $20 \%$

04-05=11: Positive torque limit

Multi-function analog input AI2 can be used to adjust the positive torque limit.
04-05=12: Negative torque limit
Multi-function analog input AI2 can be used to adjust the negative torque limit.
04-05=13: Regenerative torque limit

Multi-function analog input AI2 can be used to adjust the regenerative torque limit.

04－05＝14：Positive／negative torque limits
Multi－function analog input AI2 can be used to adjust both the positive and negative torque limit．
For more details on torque limits，please refer to parameter group 21 －torque control group．
04－05＝15：Reserved
04－05＝16：Torque compensation of speed control

Multi－function analog input AI2 can be used to adjust the torque compensation in closed loop vector mode．
For more details on the torque control functions，please refer to parameter group 21 －torque control group．

For the analog output and related parameters，refer to Fig．4．4．40．

Figure 4．4．40 Analog outputs and related parameters
Analog output AO1 and AO2 adjustment（04－12，04－13 and 04－17，04－18）

Signal：Use parameter 04－11 to select the analog output signal for AO1 and parameter 04－16 to select the analog output signal for AO2．

Gain：Use parameter 04－12 to adjust the gain for AO1 and parameter 04－17 to adjust the gain for AO2．
Adjust the gain so that the analog output（10V／20mA）matches $100 \%$ of the selected analog output signal （04－11 for AO1 and 04－16 for AO2）．

Bias：Use parameter 04－13 to adjust the bias for AO1 and parameter 04－18 to adjust the bias for AO2．
Adjust the bias so that the analog output（ $0 \mathrm{~V} / 4 \mathrm{~mA}$ ）matches $0 \%$ of the selected analog output signal （04－11 for AO1 and 04－16 for AO2）．

| $04-20$ | Filter Time of AO Signal Scan |
| :--- | :--- |
| Range | $\lfloor 0.00 \sim 0.50 】$ Sec |

*1: It is new added in inverter software V1.4.
This function is used for filtering out momentary change of analog output signal.
Note: When this function is added, it will decrease the system reaction but increase interference protection.

## Group 05 Multi－Speed Parameters

| $05-00$ | Acceleration and Deceleration Selection of Multi－Speed |
| :---: | :---: |
| Range | 【0】：Acceleration and deceleration time are set by 00－14～00－24 |
|  | 【1】：Acceleration and Deceleration Time are set by 05－17 $\sim 05-48$ |

05－00＝0：Standard Acceleration and deceleration times parameters 00－14～00－17／00－21～00－24 are used for multi－speed $0 \sim 15$ ．

05－00＝1：Each multi－speed uses a dedicated acceleration and deceleration time parameters 05－17～ $05-48$ ．There are two different modes for acceleration／deceleration timing when 05－00 is set to 1 ，see time example on the next page．

## Acceleration time calculation formula

$$
\text { Acceleration time } x \text { (set frequency - output frequency) }
$$

Time it takes to reach set frequency $=$

> Maximum output frequency

## Deceleration time calculation formula

> Deceleration time x (output frequency - set frequency)

Time it takes to reach set frequency $=$

> Maximum output frequency

Maximum output frequency：Parameter $01-00=F$ ，maximum output frequency set by 01－02，01－00 $\neq \mathrm{F}$ ， maximum output frequency determined by V／F curve selected（50．0／ 60.0 ／ 90.0 ／ 120.0 ／180．0）．

Example ：01－00＝01（ 50 Hz （maximum output frequency）， $05-02=10 \mathrm{~Hz}$（multi－step speed 0 ），05－17＝5．0s （Acceleration time），05－18＝20．0 sec．（Deceleration time）．

## Acceleration time calculation formula

Time it takes to reach set frequency $=\frac{5.0 \times 10 \mathrm{~Hz}}{50 \mathrm{~Hz}}=1.0 \mathrm{sec}$ ．

## Deceleration time calculation formula

Time it takes to reach set frequency $=$

$$
\frac{20.0 \times 10 \mathrm{~Hz}}{50 \mathrm{~Hz}}=4.0 \mathrm{sec} .
$$

Example：Acceleration／deceleration timing when $05-00$ is set to 1 ．In this example the following parameters are set：

00－02＝1（External Terminal Operation）
03－00＝0（Terminal S1：Forward／Stop）
03－01＝1（Terminal S2：Reversal／Stop）
03－02＝2（Terminal S3：Speed 1）
03－03＝3（Terminal S4：Speed 2）
03－03＝4（Terminal S5：Speed 3）
＊Speed 1 is required to confirm if $\mathrm{Al2}$ function setting（04－05）is set to 0 （Auxiliary frequency）．If 04－05＝0，it will make the frequency of speed 1 set to AI2 auxiliary frequency and the value is determined by AI2．If function of speed 1 is generally used，set AI2 to other functions except 0 （the recommended value：set 10 ADD to Al1．）

## Acceleration / Deceleration Calculation Mode 1:

If the run command is cycled on and off, acceleration and deceleration time $(a \sim f)$ is calculated based on the active speed command as follows:

|  | Off |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
| Terminal S2 |  | On | Off |  |

Terminal S4 $\qquad$

$$
\begin{array}{ll}
a=\frac{(05-17) \times(05-01)}{(01-02)} & b=\frac{(05-18) \times(05-01)}{(01-02)} \quad c=\frac{(05-19) \times(05-02)}{(01-02)} \text { in sec. } \\
d=\frac{(05-20) \times(05-02)}{(01-02)} & e=\frac{(05-21) \times(05-03)}{(01-02)} \quad f=\frac{(05-22) \times(05-03)}{(01-02)} \text { in sec. }
\end{array}
$$

## Acceleration／Deceleration Calculation Mode 2：

If the run command is remains on，acceleration and deceleration time $(a \sim f)$ is calculated based on the active speed command as follows：

$$
\begin{aligned}
& a=\frac{(05-17) \times(05-01)}{(01-02)} \quad b=\frac{(05-19) \times[(05-02)-(05-01)]}{(01-02)} \quad c=\frac{(05-21) \times[(05-03)-(05-02)]}{(01-02)} \text { in sec. } \\
& d=\frac{(05-24) \times[(05-03)-(05-04)]}{(01-02)} \quad e=\frac{(05-26) \times(05-04)}{(01-02)} \quad f=\frac{(05-25) \times(05-05)}{(01-02)} \text { in sec. } \\
& g=\frac{(05-27) \times(05-05)}{(01-02)} \quad h=\frac{(05-27) \times(05-06)}{(01-02)} \quad i=\frac{(05-19) \times(05-06)}{(01-02)} \text { in sec. }
\end{aligned}
$$

## Group 06 Automatic Program Operation Parameters

| 06－00 | Automatic Operation Mode Selection |
| :---: | :---: |
| Range | 【0】 ：Disable |
|  | 【1，4】：Execute a single cycle operation．Restart speed is based on the previous stopped speed． |
|  | 【2，5】 ：Execute continuous cycle operation．Restart speed is based on the previous cycle stop speed． |
|  | 【3，6】：After completion of a single cycle，the on－going operation speed is based on the speed of the last stage．Restart speed is based on the previous stopped speed |
|  | 1 to 3：After a stop the inverter will start with the incomplete step when the run command is re－applied． |
|  | 4 to 6：After a stop the inverter will start with the first step of the cycle when the run command is re－applied． |

Automatic operation mode uses frequency reference parameters 05－01，06－01～06－15，operation time parameters 06－16 $\sim 06-31$ and direction of operation parameters 06－32～06－47．

Note：The automatic operation mode is disabled when any of the following functions are enabled：
－Frequency wobbling function
－PID function
－Parameters 06－16 to 06－31 are set to 0.

## Notes：

－When automatic operation mode is enabled multi－step speed reference command 1～4 （03－00～03－07＝2～5）is disabled．
－Frequency of multi－step speed 0 is set by 05－01．
－Acceleration／deceleration time is set by parameter 00－14 and 00－15 in automatic operation mode．

Automatic operation frequency reference settings

| 06－01 | ＊Frequency Setting of Operation－Stage 1 | ＊1 |
| :---: | :---: | :---: |
| 06－02 | ＊Frequency Setting of Operation－Stage 2 | ＊1 |

| $06-46$ | Direction Selection of Operation -Stage 14 |
| $06-47$ | Direction Selection of Operation -Stage 15 |
| Range | 0 : Stop, 1: Forward, 2: Reversal |

Example 1: Automatic operation mode - Single cycle
In this example the inverter executes a single cycle and then stops.

## Parameter Settings:

| $06-00$ | $=1($ Single cycle operation) |
| :--- | :--- |
| $06-32 \sim 06-34$ | $=1$ (Forward for operation stage $0-2)$ |
| $06-47$ | $=2($ Reversal for operation stage 15) |
| $06-35 \sim 06-46$ | $=0($ Stop for operation frequency stage $3-14)$ |
| $05-01$ | $=15 \mathrm{~Hz}$ (Operation frequency stage $0: 15 \mathrm{~Hz})$ |
| $06-01$ | $=30 \mathrm{~Hz}$ (Operation frequency stage 1: 30 Hz$)$ |
| $06-02$ | $=50 \mathrm{~Hz}$ (Operation frequency stage $2: 50 \mathrm{~Hz})$ |
| $06-15$ | $=20 \mathrm{~Hz}$ (Operation frequency stage $15: 20 \mathrm{~Hz})$ |
| $06-16$ | $=20 \mathrm{sec}$ (Operation time stage $0: 20 \mathrm{sec})$ |
| $06-17$ | $=25 \mathrm{sec}$ (Operation time stage $1: 25 \mathrm{sec})$ |
| $06-18$ | $=30 \mathrm{sec}$ (Operation time stage $2: 30 \mathrm{sec})$ |
| $06-31$ | $=40 \mathrm{sec}$ (Operation time stage $15: 40 \mathrm{sec})$ |

Figure 4.4.42 Single cycle automatic operation (stop)

Example 2: Automatic operation mode - Continuous cycle
In this example the inverter repeats the same cycle.

## Parameter Settings:

06-00 = $\quad 2$ or 5 (Continuous cycle operation)
06-01~06-47=Enter same setting as that of Example 1.

Figure 4.4.43 Periodic automatic operation

Example 3: Automatic operation mode - Single cycle and continue running at last speed of the cycle In this example the inverter executes a single cycle and continue running at last speed of the cycle.

Figure 4.4.44 Single cycle automatic operation (continuous)

## $06-00=1$ to 3 :

After a stop the inverter will start with the incomplete step when the run command is re-applied.
$06-00=4$ to 6 :
After a stop the inverter will start with the first step of the cycle when the run command is re-applied.

## Notes:

- Acceleration/ deceleration time is set with parameters 00-14 and 00-15 in automatic operation mode.
- If the setting value of parameters $06-16 \sim 06-31$ is 0 , automatic operation mode is not active.

## Group 07：Start／Stop Parameters

| $07-00$ | Momentary Power Loss／Fault Restart Selection |
| :--- | :--- |
| Range | 【0】：Disable |
|  | $【 1 】:$ Enable |

$\mathbf{0 7 - 0 0}=\mathbf{0}$ ：Inverter trips on＂UV＂fault if power loss time is greater than 8 ms ．
$\mathbf{0 7 - 0 0}=1$ ：Inverter restarts after restarting the power at the momentary power loss．
Note：When $07-00=1$ ，inverter restore automatically the motor rotation after restarting the power even if momentary power loss occurs．

| $07-01$ | Fault Auto－Restart Time |
| :--- | :--- |
| Range | $【 0 \sim 7200 】$ Sec |

$07-01=0$ sec．：$\quad$ Automatic restart time interval is set by minimum baseblock time（07－18）．
$07-01<07-18: \quad$ Automatic restart time interval is set by minimum baseblock time（ $07-18$ ）． $07-01>07-18: \quad$ Automatic restart time interval is set by fault reset time（07－01）．

## Note：

Automatic restart time interval is time of 07－18 plus 07－01 and delay time of peed search（07－22）．
Refer to Fig．4．4．45 for setting automatic restart interval．

Figure 4．4．45 Automatic restart operation

| $07-02$ | Number of Fault Auto－Restart Attempts |
| :--- | :--- |
| Range | $【 0 \sim 10 】$ |

When the automatic restart function is enabled the internal automatic restart attempt counter is reset based on the following actions：
a）No fault occurs in 10 minutes or longer after the automatic restart
b）Reset command to clear fault via input terminal or using the keypad（ex：press reset／ $\mathbb{k}$ key）
c）Power to the inverter is turned off and back on again

## Note：

Multi－function digital output R1A－R1C，R2A－R2C，R3A－R3C can be programmed to activate during an automatic reset attempt，refer to parameter 03－11，03－12 and 03－39．

## Automatic restart operation：

a）Fault is detected．The inverter turn off the output，displays the fault on the keypad and waits for the minimum baseblock time parameter 07－18 to expire before accepting another run／automatic restart command．
b）After the minimum baseblock time（07－18）has expired，the active fault is reset and a speed search operation is performed．The time between each fault restart attempt is set by parameter 07－01．
c）When the total numbers of restart attempts exceed the number of automatic restart attempts set in parameter 07－02，the inverter will turn off the output and the fault contact is activated．

Please refer to Figure 4．4．46 for the automatic restart operation．

Figure 4．4．46 Auto－restart operation

The automatic restart function is active for the following faults．Please note that when the fault is not listed in the table the inverter will not attempt an automatic restart．

| Parameter Name | Faults |  | Numbers of Restart |
| :---: | :---: | :---: | :---: |
| 07－00 | UV（under voltage） |  | Unlimited |
| $07-01$ $07-02$ | OC（over current） OCA（over current in ACC．） OCC（over current in constant speed） <br> OCd（over current in DEC） <br> OL1（motor overload） <br> UT（Under torque detection） <br> IPL（input phase loss） | GF（ground failure） OV（overvoltage） <br> OL2（Inverter overload） OT（Over－torque detection） OPL（Output phase loss） <br> CF07（SLV motor control setting fault） <br> CF08（PMSLV motor control setting fault） | Depend on parameter 07－02 |

## Notes：

1．Fault restart function contains momentary power loss restart and auto reset restart．
2．Refer to chapter 10 for the details of troubleshooting and fault diagnostics．
3．Refer to speed search function（07－19～07－24）for the selection of speed search modes．

## Note：

Automatic restart function is only active in the state of no harm to the safety or to the application devices．
Warning－Excessively use of the automatic restart function will damage the inverter．

| $07-04$ | Automatic start at power up |
| :---: | :--- |
| Range | 【0】：Automatic start at power up when external run command is enabled |
|  | $【 1 】:$ Without automatic start at power up when external run command is enabled |

## 07－04＝ 0

If the running switch is in conducting state when power supply is on，the inverter will start automatically．

## 07－04＝1：

If the running switch is not in conducting state when power supply is on，the inverter will not start automatically and STP1 will flash．It is required to switch off the running switch and make it be in conducting state so as to start the inverter．

| $07-05$ | Automatic start delay at power up |
| :--- | :--- |
| Range | $【 1.0 \sim 300.0 】$ Sec |

When $07-04=0$, if power supply is on, the inverter automatically start at power up and it will count the delay time set by 07-05. The inverter starts running only when the delay time ends.

## ! Warning:

- When 07-04 = 0 and run command source is set to external control ( $00-\mathbf{0 2 / 0 0}-03=1$ ), if running switch is in conducting state and the inverter starts automatically when power supply is on, customers are suggested to switch off the power supply and running switch at power loss to prevent from the damage to the inverter and user when reconnecting.
- When 07-04 = 1 and run command source is set to external control (00-02/00-03 = 1), if running switch is not in conducting state when power supply is on, the inverter will not start automatically and STP1 will flash. It is required to switch off the running switch and then make it be in conducting state and start the inverter after the delay time of automatic start at power up ends.

| $07-06$ | DC injection braking starting frequency |
| :--- | :--- |
| Range | $0.0 \sim 10.0 \mathrm{~Hz}$ |

The braking opearion is controlled by the different control modes (00-00), please refer to the following descriptions:

1. Control mode: VF, SLV $(00-00=0,2)$

When the inverter runs, DC injection braking is enabled by the time of parameter 07-16. Deceleration to stop is according to 07-06 and 07-08. When output frequency is lower than 07-06 in deceleration time, it starts DC injection braking by the time of 07-08.

Figure 4.4.47a VF, VF+PG, SLV and SLV2 DC injection braking
Note: When 07-06<01-08, It start DC injection braking by the setting frequency (01-08)
2. Control mode: PMSLV $(00-00=5)$

- Set short-circuit breaking time at start by 07-34 and DC braking time by 07-16. Braking action at start runs by the setting time of 07-34 (short-circuit braking) and then by that of 07-16 (DC braking).
- Deceleration to stop is set by 07-35 (short-circuit braking) and 07-08 (DC braking). When output frequency is lower than 07-06 in deceleration, braking action runs by the setting time of 07-35 (short-circuit braking) and then by that of 07-08 (DC braking).
Note: If 07-06 < 01-08, braking function starts at the setting frequency of 01-08. Refer to the following figure 4.4.47b.
- Set DC braking current level by 07-07 on the base of the inverter rated current being $100 \%$. If the setting value of 07-07 is higher than the motor rated current, DC braking current level is limited to the motor rated value.
- Set short-circuit braking current level by 07-36 on the base of the motor rated current being 100\%.

Figure 4．4．47b PMSLV braking action

| $07-07$ | DC Injection Braking Current |
| :--- | :--- |
| Range | 【0～100】\％ |

DC Injection braking current as percentage of the inverter rated current．Increasing this level will increase the amount of heat generated by the motor windings．Do not set this parameter higher than the level necessary to hold the motor shaft．

| $07-08$ | DC Injection Braking Time at Stop |
| :--- | :--- |
| Range | $【 0.00 \sim 10.00 】$ Sec |

Duration of DC injection braking is during a stop operation．DC injection braking at stop is disabled when parameter 07－08 is set to 0 sec ．

| $07-16$ | DC Injection Braking Time at Start |
| :---: | :--- |
| Range | $【 0.00 \sim 100.00 】$ Sec |

Duration of DC injection braking is during a start operation．DC injection braking at start is disabled when parameter $07-16$ is set to 0 sec ．

## DC Injection Braking Operation

When DC Injection braking is active DC voltage is applied to the motor，increasing the braking current and resulting in an increase in the strength of the magnetic field trying to lock the motor shaft．

To enable DC injection braking during a start operation set the DC injection braking current（07－07）and the $D C$ injection braking time（07－16）at start to a value greater than 0 ．DC injection braking at start can be used to prevent＂wind milling effect＂in fan applications．

To enable DC injection braking during a stop operation set the DC injection braking current（07－07）and the DC injection braking time at stop $(07-08)$ to a value greater than 0.

## Notes：

－When parameter 07－16 is set to 0 sec（DC injection braking off）．the inverter will start from the minimum output frequency．
－Increasing the DC braking time（07－08，07－16）can reduce the motor stop time．
－Increasing the DC braking current（07－07）can reduce the motor stop time．
－During stop operation：If the DC braking start frequency＜minimum output frequency（01－08），DC braking is activated when the output frequency reaches the minimum output frequency level．

Figure 4．4．47c DC braking operation
DC braking operation can be controlled via any one of the multi－function input terminals（03－00 to 05） function 33．Refer to Fig．4．4．47 for DC braking operation．

DC braking current can be controlled via the multi－function analog input（04－05 or 04－10）function 5 ．Refer to Fig．4．4．34．

| $07-34$ | Short－circuit braking time at Start |
| :--- | :--- |
| Range | $【 0.00 \sim 100.00 】$ Sec |
| $07-35$ | Short－circuit braking time at Stop |
| Range | 【0．00～100．00】 Sec |
| $07-36$ | Short－circuit braking current limited level |
| Range | $【 0.0 \sim 200.0 】 \%$ |

PMSLV control mode is available for short－circuit braking．Short－circuit braking is the way to switch IGBT to produce braking torque．Setting value of 07－06，07－34，07－35 and 07－36 can adjust the braking action process．

If $07-35=0$ ，Inverter starts from the minimum frequency．
The setting value of $07-36$ depends on the motor rated current being $100 \%$ ．（ex．motor rated current is 5 A ， $07-36=100 \%$ is 5 A ）

03－00～03－07＝65，it can control Short－circuit braking action．

| $07-09$ | Stop Mode Selection |
| :--- | :--- |
| Range | 【0】：Deceleration to Stop |
|  | 【1】 ：Coast to Stop |
|  | 【2】：DC Braking Stop |
|  | 【3】：Coast to Stop with Timer |

When a stop command is issued the inverter stops according to the stop mode selected．There are four types of stop modes，

Note：When using the permanent magnet motor，only the option of deceleration to stop mode is available．
07－09＝0：Deceleration to stop

When a stop command is issued，the motor will decelerate to the minimum output frequency（01－08）Fmin and then stop．Deceleration rate depends on the deceleration time（factory default：00－15）．

When the output frequency reaches the DC braking stop frequency (07-06) or the minimum output frequency (01-08), DC injection braking is activated and the motor stops.

Output frequency when stop command is issued
Deceleration time $=$
Maximum output frequency $F_{\max }(01-02)$

Note: S curve setting will add to the overall stop time

Figure 4.4.48 Deceleration to stop
07-09=1: Coast to stop
When a stop command is issued, the motor will coast to a stop. Stop time depends on motor load and friction of the system.

The inverter waits for the time set in the minimum baseblock time (07-18) before accepting the next run command.

In SLV mode (00-00=2) the speed search function is automatically enabled upon the next run command.
Note: When using a mechanical brake set parameter 07-26 to 1.

Figure 4.4.49 Coast to stop

07-09=2: DC braking to stop
When a stop command is issued, the inverter will turn off the output (Baseblock) and after the minimum Baseblock time (07-18) has expired activate DC braking (07-07). Refer to Fig.4.4.50.

The DC braking time (tDCDB) of Figure 4.4 .50 is determined by the value of 07-08 (DC Braking start time) and the output frequency at the time the stop command was issued.
tDCDB $=$
(07-08) x $10 \times$ output frequency
Fmax (01-02)
Note: Increase the minimum Baseblock time (07-18) in case an Overcurrent trip occurs during the DC braking.

tb.b :Minimum baseblock time (07-18) tocde :DC braking time

Figure 4.4.50 DC braking to stop

07-09=3: Coast to stop with timer
When a stop command is issued the motor will coast to a stop after the minimum Baseblock time (07-18) has expired. The inverter ignores the run command until the total time of the timer has expired.

The total time of the timer is determined by the deceleration time $(00-15,17,22$ or 24$)$ and the output frequency upon stop. Refer to Fig.4.4.51

Figure 4.4.51 Coast to stop with timer

| $07-13$ | Low Voltage Detection Level |
| :--- | :--- |
| Range | $【 200 V 】: 150 \sim 300 V$ <br> $【 400 V 】: 300 \sim 600 V$ |
| $07-25$ | Low voltage Detection Time |
| Range | $【 0.00 \sim 1.00 】$ Sec |

Adjust the $07-13$ voltage level from 150 to 300 Vdc （ 200 V class）or from 300 to 600 Vdc （ 400 V class）．
When the AC input voltage is lower than the 07－13 value（07－13／1．414＝AC voltage detection level）for the time specified in 07－25 the low－voltage error＂UV＂will displayed．If $07-25=0.00$ sec．，the UV error will be displayed immediately．

Set preventive measures：
－The inverter input voltage will limit the output voltage．If the input voltage drops excessively，or if the load is too big，the motor may stall．
－If the input voltage drops below the value set in 07－13 then the output is turned off momentarily．The inverter will not automatically start when power is restored．

| $07-14$ | Pre－excitation Time |
| :--- | :--- |
| Range | $【 0.00 \sim 10.00 】$ Sec |
| $07-15$ | Pre－excitation Level |
| Range | $【 50 \sim 200 】 \%$ |

If a high starting torque is required for the application，especially for a large horsepower motors，the pre－excitation operation can be used to pre－flux（magnetize）the motor．

## 07－14：Pre－excitation time

When an operation command（forward or reverse）is activated，the inverter will automatically start pre－excitation based on the time set in parameter 07－14．

The time for the flux to reach $100 \%$ is a function value of motor＇s electrical time constant（See figure 4．4．52）．

Electrical time constant（quadratic by－pass circuit time constant）is suggested to set $2.00 \sim 4.00 \mathrm{Sec}$ ．

## 07－15：Pre－excitation initial level

Use the pre－excitation initial level（07－15）to provide a higher excitation current during the pre－excitation time（07－14），which will increase the speed and stability for motors．

In order to quickly magnetize the motor，reduce the pre－excitation time（07－14）and set the pre－excitation level（07－15）to a high level．

If $07-15$ is set greater than $100 \%$ ，providing a high excitation current during the pre－excitation time（07－14）， motor＇s magnetization time is shorted．When the setting reaches $200 \%$ ，magnetization is reduced by roughly half．

A high pre－excitation level（07－15）might result in excessive motor sound during pre－excitation．
When the flux reaches $100 \%$ ，pre－excitation current reverts back to $100 \%$ and pre－excitation is completed．

Figure 4.4.52 Pre-excitation operation

| $07-18$ | Minimum Base block Time |
| :--- | :--- |
| Range | $【 0.1 \sim 5.0 】$ Sec |

In case of a momentary power failure, the inverter continues to operate after the power has been restored when parameter 07-00 is set to 1 . Once the momentary power failure is detected; the inverter will automatically shut down the output and maintain B.B for a set time (07-18).

It is expected that after the minimum base block time has expired the residual voltage to be almost zero.

When the momentary power failure time exceeds the minimum base block time (07-18), the inverter will automatically perform a speed search upon return of power. Refer to the following figure 4.4.53.

(a) Minimum baseblock time (07-18) greater than momentary power loss time

(b) Minimum baseblock time (07-18) is shorter than momentary power loss time

Figure 4.4.53 Minimum B.B time and momentary power loss time
Minimum base block time (07-18) is also used to for the DC braking function in combination with speed search as follows:

- Set the minimum base block time required (07-18).
- Execute speed search or DC braking function.
- Increase minimum Baseblock time if over-current "OC" condition occurs.
- After speed search is completed, normal operation continues.

| 07－19 | Direction－Detection Speed Search Operating Current |

Speed search function is used to find the speed of a coasting motor and continue operation from that point． The speed search function is active after a momentary power loss．

## Speed Search from Multi－function digital inputs

Set the multi－function digital input to external speed search command 1 or 2．External speed search command 1 （value $=19$ ）and 2 （value $=34$ ）cannot be set at the same time，otherwise＂SE02＂（digital input terminal error）warning occurs．

Speed search function must be enabled before applying the run command to ensure proper operation． See relay logic in Fig．4．4．54．

Figure 4．4．54 Speed search and operation commands

## Notes: Speed Search Operation

- The speed search cannot be used when the motor rated power is greater than the inverter rated power.
- The speed search cannot be used when the motor rated power is two inverter sizes smaller than the inverter currently used.
- The speed search cannot be used in combination with a high-speed motor.
- If speed search function is used and the control mode is in V/F mode, it is necessary to perform a static auto-tune.
- If speed search function is used and the control mode is in SLV mode, it is necessary to perform a rotational auto-tune. Perform a static auto-tune when using long motor leads.

Speed search uses current detecting. Use parameter 07-24 to select detection direction.

## 07-19: Speed Direction Search Operating Current

- Used in bidirectional speed search only (07-24 = 1).
- Set bidirectional current level.
- Increase value if speed search is not successful at low speeds (above 5 Hz )

Note: If value is too high may cause DC braking effect.

## 07-20: Speed Search Operating Current

- Can be used for bidirectional $(07-24=1)$ or unidirectional $(07-24=0)$ speed search.
- Sets speed search current Level.
- The set value must be lower than the excitation current (02-09) and must equal to the no-load current. If the no-load current is unknown it is recommended to set value at $20 \%$.
- Excessive speed search current will cause inverter output to saturate.
- It is recommended to use speed search in case of a momentary power loss. Increase the minimum base block time (07-18) in case of an over-current condition.

## 07-21: Integral time of speed searching

- Can be used for bidirectional $(07-24=1)$ or unidirectional $(07-24=0)$ speed search.
- Set the integral time during speed search.
- If OV occurs, increase the set value to increase the speed search time. Decrease the value if a quick start is required

## 07-22: Delay time of speed search

- Use delay time when using a contactor on the inverter output side.
- The inverter speed search starts after the delay time expires.
- Speed search delay time is disabled when set to 0.0 sec. $(07-22=0.0)$

## 07-23: Voltage recovery time

- Sets the voltage recovery time.
- Sets the time for the inverter to restore the output voltage from 0 V to the specified $\mathrm{V} / \mathrm{f}$ level after speed search function is completed.

## 07-24: Direction-Detection Speed Search Selection

## 07-24=0: Disable Direction-Detection Speed Search

Speed search is executed using speed search operating current defined in parameter 07-20. In case speed search is not successful (e.g. motor speed is too low) a speed search time-out warning is displayed.

Set 07-19 to value greater than 0 to enable DC braking at speed search if a time-out occurs frequently.

## 07-24=1: Enable Direction-Detection Speed Search

At start the current controller will send a step current to the motor (07-19) to determine the motor direction. Once direction is determined the current controller will perform a speed search using speed search operating current defined in parameter 07-20. Speed search is executed after a momentary power loss (external speed search command 2, 03-00 to 03-05 = 34) or from max. frequency (external speed search command $1,03-00$ to $03-05=19$ ). Speed search direction will follow the speed command.

## 07-26: SLV Speed Search Function

- In SLV mode $(00-00=2)$ set the stop mode to the coast stop $(07-09=1)$ or to the coast to stop with timer $(07-09=3)$. After a stop command is issued (coast to stop or coast to stop with times) the speed search function is automatically activated for the next start.

07-26=0: Enable (No mechanical brake is installed)
07-26=1: Disable (Mechanical brake is installed)

## 07-27: Start Selection after fault during SLV mode

07-27=0: Speed search start: Speed search is executed after a fault in SLV mode.
07-27=1: Normal start: Speed search is not enabled.

Note: Set the parameter to 1 (normal start) after a fault has occurred and a mechanical brake is used to stop the motor.

## 07-28: Start after external Baseblock

07-28=0: Speed search start: Speed search is executed after base block is removed.

07-28=1: Normal start: Speed search is not enabled.

## 07-32: Speed Search Mode Selection

0: Disable: The inverter start to run from the lowest output frequency but it won't limit the other functions of trigger speed search.

1: Execute a Speed Search at Power On: The inverter executes a speed search at power on when entering first run command. It start the motor from found frequency.

2: The inverter will start speed search upon the motor run to find the exact frequency.

## 07-33: Start Frequency of Speed Search Selection

0: Maximum Output Frequency of Motor: The inverter start speed search from the maximum output frequency of motor.
1: Frequency Command: The inverter start speed search from setting frequency command.

## Notes:

- Set parameter to 1 for the control mode of SLV mode $(00-00=2)$ when the external base block
active time is longer than the time the motor needs to come to a complete stop. After the external base block command is removed the inverter will accelerate from min. frequency.
- The inverter has no choices but can only normally start when using permanent magnetic motor.

## $■$ Speed search based on current detection

(a) Speed search at starting

Figure 4.4.55 Speed search at starting
(b) Speed search in recovery period of momentary power failure

Figure 4.4.56 Speed search in recovery period of momentary power failure

## Notes:

- If the minimum base block time (07-18) is longer than the momentary power failure time, the speed search starts operation after the minimum base block time (07-18).
- If the minimum base block time (07-18) is too short, the speed search operation begins immediately after power has been restored.

| 07－29 | Run Command Available during DC Braking |
| :---: | :--- |
| Range | 【0】：Disable（Run command isn＇t available until the DC braking is completely done） |
|  | 【1】：Enable |

After DC braking action starts，if run command selection is set to 0 ，it will not run until DC braking action ends．

If run command selection is set to 1 ，it is not required to wait for the ending of $D C$ braking action．It can run during DC braking action process．

| $07-42$ | Voltage Limit Gain |
| :--- | :--- |
| Range | $【 0.0 \sim 50.0 】 \%$ |

When output voltage saturation happen，and the motor running is not normal，increase this parameter to limit the output voltage．
But when this parameter is too big，the output torque maybe not enough，please decrease this parameter．

| $07-43$ | Short－circuit Braking Time of PM Motor Speed Search |
| :---: | :---: |
| Range | $【 0.00 \sim 100.00 】$ Sec |
| $07-44$ | DC Braking Time of PM Motor Speed Search |
| Range | $【 0.00 \sim 100.00 】$ Sec |

If the motor is in a rotating state due to inertia and the rotation speed is far below the minimum speed control range，parameters $07-43$ and $07-44$ are available to perform braking action to let the motor stop and then restart．

If the motor is in a rotating state due to inertia and the rotation speed is higher than the minimum speed control range，the motor starts in a certain searched frequency regardless of the setting value of parameter 07－43 or 07－44．

If parameters 07－43 and 07－44 are set to 0 ，the motor starts in a certain searched frequency after motor＇s speed search stops regardless of motor＇s rotarion speed．

| $07-45$ | STP2 Function Selection |
| :---: | :---: |
| Range | 【0】：STP2 is enabled |
|  | $【 1 】:$ STP2 is disabled |

$>$ If STP2 is enabled，when $00-02=1$ and external operation signal is tripped，keypad will display ＂Terminal STOP＂error when stop command comes from keypad．
$>$ If STP2 is disabled，when 00－02＝1 and external operation signal is tripped，keypad will not display ＂Terminal STOP＂error when stop command comes from keypad．

| $\mathbf{0 7 - 4 7}$ | PM Speed Switching Frequency Mode |
| :--- | :--- |
| Range | 【0】：Disabled |
|  | 【1】：Mode 1 |
|  | 【2】：Mode 2 |

If switch the three－speed speed switching according to the following figure，use the 00－25
（acceleration／deceleration switching frequency）$\neq 0$ and 22－11（I／f mode starting frequency switching point） parameters for frequency switching acceleration and deceleration：
Invalid：Please refer to the 00－25 parameter frequency for speed switching．
Mode 1：After the power is turned on，the speed can be switched，and the speed is switched according to the following figure．
Mode 2：The speed switching of the following figure can be realized only for the first operation，but the 22－11 switching will be invalid when decelerating．

Note: When 00-25 $\ddagger 0$, the switching frequency can't be less than the 22-11 parameter frequency setting, and this parameter is enabled only in PMSLV mode.

## Group 08 Protection Parameters

| Range | 【1～100】 \％ |
| 08－22 | Stall Prevention Detection Time in Operation |
| Range | 【2～100】 msec |

Note：Stall prevention function only can be set in V／F control mode．

## Stall prevention during acceleration（08－00＝xxx0b）

（1）Prevents the inverter from faulting（Overcurrent，Motor overload，Inverter overload）when accelerating with heavy loads．
（2）When the inverter output current reaches the level set in parameter 08－01 minus $15 \%$ the acceleration rate starts to decrease．When the inverter output current reaches the level set in parameter 08－01 the motor stops accelerating．
（3）Reduce stall prevention level during acceleration（08－01）in case the motor stalls（when the motor power is smaller than the inverter rating．

## Stall prevention during acceleration（08－00＝xxx0b）

Prevents the inverter from faulting（Overcurrent，Motor overload，Inverter overload）when accelerating with heavy loads．

When the inverter output current reaches the level set in parameter 08－01 minus $15 \%$ the acceleration rate starts to decrease．When the inverter output current reaches the level set in parameter 08－01 the motor stops accelerating．Refer to Fig．4．4．57 for more information．

## Notes：

－Reduce stall prevention level during acceleration（08－01）in case the motor stalls（when the motor power is smaller than the inverter rating．
－The inverter rated output current should be set to $100 \%$ ．

Figure 4.4.57 Stall prevention during acceleration

If the motor is used in the constant power $(\mathrm{CH})$ region, the stall prevention level (08-01) is automatically reduced to prevent the stall.

Stall prevention level during acceleration (Constant horsepower)
Stall Prev. Lev. Acceleration $(\mathrm{CH})=$ Stall prevention level in acceleration (08-01) x Fbase (01-12)
Output frequency

Parameter 08-21 is the stall prevention limit value in Constant Horsepower region. Refer to Fig.4.4.58.

Figure 4.4.58 Stall prevention level and limit in acceleration

## Stall prevention selection during deceleration (08-00=xx0xb)

Stall prevention during deceleration automatically increases the deceleration time according based on the DC-bus voltage to prevent over-voltage during deceleration. Refer to Fig.4.4.59 for stall prevention during deceleration

When the DC-bus voltage exceeds the stall prevention level deceleration will stop and the inverter will wait for the DC-bus voltage to fall below the stall prevention level before continuing deceleration. Stall prevention level can be set by 08-02, see Table 4.4.10.

Table 4.4.10 Stall prevention level

| Inverter model | 08-02 default value |
| :---: | :---: |
| 200 V class | 385 VDC |
| 400 V class | 770 VDC |

Note: When using external braking (braking resistor or braking module) disable stall prevention during deceleration (08-00 to xx1xb).

Figure 4.4.59 Stall prevention selection in deceleration

## Stall prevention selection during run (08-00=x0xxb)

Stall prevention during run can only be used in V/F control mode for induction motor.
This function prevents the motor from stalling by automatically reducing the output frequency during run.
If the inverter output current rises above the level set in parameter 08-03 for the time specified in parameter 08-22, the inverter output frequency is automatically decreased following deceleration time 1 (00-15) or deceleration time $2(00-17)$.

When the inverter output current falls below the level set in parameter (08-03) minus $2 \%$, normal operation continues and the output frequency increases to the frequency reference using the acceleration time 1 or acceleration time 2. Refer to the following Fig.4.4.60.

Note: The stall prevention level during run can be set by using multi-function analog input $\mathrm{Al} 2(04-05=7)$ or AI3(04-10=7).

Figure 4．4．60 Stall prevention selection in operation

| 08－05 | Selection for Motor Overload Protection（OL1） |
| :---: | :---: |
| Range | 【xxx0b】：Motor Overload Protection is disabled． <br> 【xxx1b】：Motor Overload Protection is enabled． <br> 【xx0xb】：Cold Start of Motor Overload <br> 【xx1xb】：Hot Start of Motor Overload <br> 【x0xxb】：Standard Motor <br> 【x1xxb】：Special motor <br> 【0xxxb】：Reserved <br> 【1xxxb】：Reserved |
| 08－07 | Motor Overload（OL1）Protection Level |
| Range | 【0】：Motor Overload（OL1）Protection 0 <br> 【1】 ：Motor Overload（OL1）Protection 1 <br> 【2】 ：Motor Overload（OL1）Protection 2 |

The motor overload protection function estimates the motor overload level based on the output current， output frequency，motor characteristics and time．The motor overload trip time depends on the motor rated current when the output frequency is higher than 60 Hz ．

On inverter power－up the motor overload protection internal thermal accumulation register is automatically reset．

To use the built－in motor overload protection function parameter 02－01（motor rated current）has to match the motor rated current on the motor nameplate．

Turn off the motor overload protection when using two or more motors connected to the inverter（set 08－05 $=x x x 0 b)$ ，and provide external overload protection for each motor（e．g．thermal overload switch）．

With cold start enabled（ $08-05=x x 0 x b$ ），motor overload protection occurs in 5 and a half minutes when operating the motor at $150 \%$ of the motor rated current at an output frequency greater than 60 Hz ．

With hot start enabled (08-05 = xx1xb), motor overload protection occurs in 3 and a half minutes when operating the motor at $150 \%$ of the motor rated current at an output frequency greater than 60 Hz .

Refer to the following Fig.4.4.61 for an example of motor overload protection standard curve.
And refer to the setting of $08-07$ (Motor overload (OL1) protection level), the overload curve will be different.
$08-07=0$ :

08-07=1:

$08-07=2$ :

Figure 4.4.61 Motor overload protection curve (example: standard motor)

When using force cooled motors (Special inverter motor), thermal characteristics are independent of the motor speed, set 08-05 = x1xxb.

When 08-05 = x1xxb, overload protection function is based on motor rated current for output frequencies between 6 and 60 Hz . If the output frequency is lower than 1 Hz , the overload protection function uses $83 \%$ of the motor rated current to determine an overload condition.

When 08-05 = x0xxb, overload protection function is based on $70 \%$ of the motor rated current for an output frequency of 20 Hz . If the output frequency is lower than 1 Hz , the overload protection function uses $40 \%$ of the motor rated current to determine an overload condition.

Refer to Fig.4.4.62 for motor overload rating at different output frequencies.

Figure 4.4.62 Motor overload rating at different output frequencies

| $08-06$ | Start－up mode of overload protection operation（OL1） |
| :---: | :---: |
| Range | 【0】：Stop Output after Overload Protection |
|  | 【1】：Continuous Operation after Overload Protection． |

08－06＝0：When the inverter detects a motor overload the inverter output is turned off and the OL1 fault message will display on the keypad．Press RESET button on the keypad or activate the reset function through the multi－function inputs to reset the OL1 fault．

08－06＝1：When the inverter detects a motor overload the inverter will continue running and the OL1 alarm message will flash on the keypad until the motor current falls within the normal operating range．

| $08-08$ | Automatic Voltage Regulation（AVR） |
| :--- | :--- |
| Range | 【1】 AVR is enabled  <br>  【1】 AVR is disabled |

Automatic voltage regulation stabilizes the motor voltage independent of fluctuation to the input voltage．
$\mathbf{0 8 - 0 8}=0$ ：Automatic voltage regulation is active．It will limit the maximum output voltage．When input three－phase voltage fluctuates and the voltage is smaller than the value of 01－14，the output voltage will fluctuate with the fluctuation of input voltage．

08－08＝1：Automatic voltage regulation is not active，motor voltage follows the input voltage fluctuation． When input three－phase voltage fluctuates，the output voltage won＇t fluctuate with the fluctuation of input voltage．

| $08-09$ | Selection of Input Phase Loss Protection |
| :--- | :--- |
| Range | 【0】：Disable |
|  | 【1】：Enable |

$08-09=0$ ：Input phase loss detection is disabled．

08－09＝1：Input phase loss detection is enabled．Keypad shows＂IPL input Phase Loss＂（IPL），when an input phase loss is detected the inverter output is turned off and the fault contact is activated．

Note：The input phase loss detection is disabled when the output current is less than $30 \%$ of the inverter rated current．

| $08-10$ | Selection of Output Phase Loss Protection |
| :---: | :--- |
| Range | 【0】：Disable |
| 【1】：Enable |  |

$08-10=0$ ：Output phase loss detection is disabled．
08－10＝1：Output phase loss detection is enabled．Keypad shows＂OPL Output Phase Loss＂（OPL），when an output phase loss is detected and the inverter output is turned off and the fault contact is activated．

Note：The output phase loss detection is disabled when the output current is less than $10 \%$ of the inverter rated current．

| 08－13 | Selection of Over－Torque Detection |
| :---: | :---: |
| Range | 【0】：Over－Torque Detection is Disabled． <br> 【1】：Start to Detect when Reaching the Set Frequency． <br> 【2】 ：Start to Detect when the Operation is Begun． |
| 08－14 | Selection of Over－Torque Operation |
| Range | 【0】 ：Deceleration to Stop when Over－Torque is Detected． <br> 【1】：Display Warning when Over－Torque is Detected．Go on Operation． <br> 【2】 ：Coast to Stop when Over Torque is Detected． |
| 08－15 | Level of Over－Torque Detection |
| Range | 【0～300】\％ |
| 08－16 | Time of Over－Torque Detection |
| Range | 【0．0～10．0】 Sec |
| 08－17 | Selection of Low－Torque Detection |
| Range | 【0】：Low－Torque Detection is Disabled． <br> 【1】：Start to Detect when Reaching the Set Frequency． <br> 【2】：Start to Detect when the Operation is Begun． |
| 08－18 | Selection of Low－Torque Operation |
| Range | 【0】：Deceleration to Stop when Low－Torque is Detected． <br> 【1】 ：Display Warning when Low－Torque is Detected．Go on Operation． <br> 【2】 ：Coast to Stop when Low－Torque is Detected． |
| 08－19 | Level of Low－Torque Detection |
| Range | 【0～300】\％ |
| 08－20 | Time of Low－Torque Detection |
| Range | 【0．0～10．0】 Sec |

The over torque detection function monitor the inverter output current or motor torque and can be used to detect increase in inverter current or motor torque（e．g．heavy load）．

The low torque detection function monitor the inverter output current or motor torque and can be used to detect a decrease in inverter current or motor torque（e．g．belt break）．

The torque detection levels（08－15，08－19）are based on the inverter rated output current（ $100 \%=$ inverter rated output current）when operating the inverter in V／F control mode and motor output torque（100\％＝ motor rated torque）when operating the inverter in SLV control mode．

## Over－torque detection

Parameter $08-13$ selects over－torque detection function．An over－torque condition is detected when the output current／torque rises above the level set in parameter 08－15（Over－torque detection level）for the time specified in parameter 08－06（Over－torque detection time）．
$08-13=0$ ：Over－torque detection is disabled．
$08-13=1$ ：Over－torque detection is enabled when the output frequency reaches the set frequency．
$08-13=2$ ：Over－torque detection is enabled during running．
Parameter 08－14 selects the way the inverter acts when an over－torque condition is detected．

08－14＝0：When an over－torque condition is detected the inverter displays and over－torque detection fault and the motor decelerates to a stop．

08－14＝1：When an over－torque condition is detected the inverter displays an over－torque detection alarm and continues to run．
$\mathbf{0 8 - 1 4 = 2}$ ：When an over－torque condition is detected the inverter displays and over－torque detection fault and the motor coasts to a stop．

Figure 4.4.63 Over-torque detection operation

## Low-torque detection

Parameter 08-18 selects low-torque detection function. An low-torque condition is detected when the output current / torque falls below the level set in parameter 08-19 (low-torque detection level) for the time specified in parameter 08-20 (Low-torque detection time).
$08-17=0$ : Low-torque detection is disabled.
$08-17=1$ : Low-torque detection is enabled when the output frequency reaches the set frequency.
08-17=2: Low-torque detection is enabled during running.
Parameter $08-18$ selects the way the inverter acts when an over-torque condition is detected.
$\mathbf{0 8 - 1 8 = 0}$ : When a low-torque condition is detected the inverter displays and low-torque detection fault and the motor decelerates to a stop.

08-18=1: When a low-torque condition is detected the inverter displays a low-torque detection alarm and continues to run.
$\mathbf{0 8}-\mathbf{1 8}=\mathbf{2}$ : When a low-torque condition is detected the inverter displays and low-torque detection fault and the motor coasts to a stop.

Figure 4.4.64 Low torque detection operation

Over and low torque detection condition can be output to the multi-function digital outputs (R1A-R1C, R2A-R2C, R3A-R3C) by setting parameters 03-11, 03-12 and 03-39 to 12 or 25. Refer to Fig. 4.4.65 for more information.

Figure 4．4．65 Over－torque／low torque detection multi－function digital output terminal

| $08-23$ | Ground Fault（GF）Selection |
| :--- | :--- |
| Range | $【 0 】:$ Disable |
|  | $【 1 】:$ Enable |

If the inverter leakage current is greater than $50 \%$ of inverter rated current and the ground fault function is enabled（08－23），the keypad will display a＂GF Ground Fault＂（GF），motor will coast to a stop and fault contact is activated．

| $08-24$ | Operation Selection of External Fault |
| :--- | :--- |
| Range | 【0】：Deceleration to Stop |
|  | 【1】：Coast to Stop |
|  | 【2】：Continuous Operation |

When multi－function digital input terminal is set to 25 （the external fault）and this terminal signal is triggered off，parameter 08－24（Operation Selection of External Fault）can be selected to stop it．The selection of stop modes is the same as 07－09．

| $08-25$ | Detection selection of External Fault |
| :---: | :--- |
| Range | 【0】：Immediately Detect when the Power is Supplied |
|  | 【1】：Start to Detect during Operation |

The reason for the detection of external faults is determined by parameter 08－25．
－When $08-25=0$ ，faults are immediately detected at power up．
－When $08-25=1$ ，faults are detected when the inverter is running．

| $08-30$ | Selection of Safety Function |
| :---: | :--- |
| Range | 【0】：Deceleration to Stop |
|  | 【1】：Coast to Stop |

If multi－function digital input terminal is set to 58 （Safety Function），inverter will stop via the set of 08－30 when this function is enabled．

| $08-37$ | Fan Control Function |
| :---: | :--- |
| Range | 【0】：Start at Operation |
|  | 【1】：Permanent Start |
|  | 【2】：Start at High Temperature |
| $08-38$ | Delay Time of Fan Off |
| Range | 【0～600】 Sec |

## 08－37＝0：Start at Operation

Fan starts while inverter is running．
If the inverter stops over the delay time of fan off（08－38），fan is off．

## 08－37＝1：Permanent Start

When the inverter is at power on，fan will start permanently．
08－37＝2：Start at High Temperature
When the temperature of heatsink is higher than that of internal setting，fan immediately starts
If the temperature is lower than internal setting value or the delay time of fan off（08－38）is due，fan will be off．

Note：Function of fans on is disabled for the models of 60HP or the above（200V）and 100 HP or the above （400V）in IP20 series and is enabled for all the models in IP55 series．

| 08－35 | Fault Selection of Motor Overheat |
| :---: | :---: |
| Range | 【0】：Disable <br> 【1】 ：Deceleration to Stop <br> 【2】 ：Coast to Stop |
| 08－36 | Time Coefficient of PTC Input Filter |
| Range | 【0．00～5．00】 |
| 08－39 | Delay Time of Motor Overheat Protection |
| Range | 【1～300】 Sec |
| 08－42 | PTC Trip Level |
| Range | 【0．1～10】 V |
| 08－43 | PTC Reset Level |
| Range | 【0．1～10】 V |
| 08－45 | PTC Disconnection Detection |
| Range | 【0】 ：Disable <br> 【1】 ：Warning <br> 【2】 ：Fault |

Protection of motor overheating is enabled via the sensor of motor fan with the temperature impedance chacteristics of positive temperature coefficient（PTC）．

Thermistor of PTC connects with terminals MT and GND．If motor is overheating，the keypad displays the error code of OH 4 ．
$08-35=0$ ：Fault selection of motor overheating is disabled．
08－35＝1，2：Motor stop running while fault of motor overheating occurs．
Protection of motor overheating is enabled when the motor temperature rises，and the MT voltage level is higher than 08－42 PTC trip level and the reach of delay time set by 08－39．The keypad will display an＂OH4 Motor overheat＂and fault output is active．

When the motor temperature falls，and the MT voltage level is lower than 08－43 PTC reset level，it can

Note: The stop mode of the inverter fault is set by 08-35.
$08-35=1$ : Deceleration to stop when the inverter fault occurs.
$08-35=2$ : Coast to stop when the inverter fault occurs

## Notes:

- If thermistor of PTC does not connect with MT and GND, the keypad will display an "OH4 Motor overheat."
- The value of the external thermistor of PTC is in compliance with British National Standard. When Tr is $150^{\circ} \mathrm{C}$ in class F and $180^{\circ} \mathrm{C}$ in class H ,
a. $\operatorname{Tr}-5^{\circ} \mathrm{C}: \mathrm{R}_{\text {PTC }} \leqq 550 \Omega$, use $\mathrm{R}_{\text {PTC }}$ value to formula (1), the V value can be set to $08-43$ PTC reset level.
b. $\operatorname{Tr}+5^{\circ} \mathrm{C}: \mathrm{R}_{\text {PTC }} \geqq 1330 \Omega$, use $\mathrm{R}_{\text {PTC }}$ value to formula (1), the V value can be set to $08-42$ PTC trip level

## Notes:

1. If the specification of PTC is different, please follow formula 1 to calculate the value of $8-42$ and $8-43$.
$V=\frac{1}{2} \times 10 \mathrm{~V} \times \frac{R_{P T C} / / 20 K}{10 K+\left(R_{\text {PTC }} / / 20 K\right)} \quad$ Formula (1)
2. It can be calculated via formula (1) if it is in an empty connection or disconnection state when the voltage value is between $3.3 \sim 4 \mathrm{~V}$. if empty connection or disconnection occurs, the inverter trips to PTCLS warning or fault signal. Set fault signal by parameter 08-45. There will be ten seconds to detect once disconnection occurs. If it reconnects withinthe time, PTC signal will not be tripped and it will be recounting on redisconnection.
3. When measuring the voltage-across from MT and GND terminals, the measured voltage is not equal to the input level one. The level one is calculated by formula (1).

Refer to Fig. 4.4.66 for the connecting between the corresponding temperature of thermistor of PTC and terminals.

Figure 4.4.66 (a) PTC Themistor Characteristics
(b) PTC Themistor Connections

| Range | 【00000～65534】 |
| When $08-48=0$. |  |

＞When 08－48＝0，Fire Mode is disabled．

When $08-48=1$, Fire Mode is enabled.
$>$ When fire mode is enabled, S 6 will be defined to digital input of fire mode ( $03-0 \mathrm{X}=47$ ).
When fire mode is enabled, inverter will become to fire mode. No matter inverter is running or stopping, run and frequency command source will be covered by the setting of fire mode, keypad display will show " FIRE ", some of protect functions will be ignored, please refer the table 4.3.35, inverter will not stop.
When fire mode ( $03-0 X=47$ ) and outour overload $(03-0 X=68)$ function is triggered, the other digital inputs will be ignored, the parameters just can be read by communication or keypad display.
> When 08-49=0, pelase disconnect the power first, remove external trigger signal and then connect the power.
$>$ When 08-49=1, no need to disconnect the power, inverter will become to normal mode, run and frequency will reture to original setting.

Note: Only Version V1.53 and above will meet the above functions.
Table 4.3.35 These functions will be ignoed when fire mode is triggered

| $0 \times 2521 \mathrm{H}$ | Fault Description |
| :--- | :--- |
| 4 | OH 1 (Heat sink over heat) |
| 5 | OL1 (Motor overload) |
| 6 | OL2 (Inverter overload) |

| 25 | FB (PID feedback signal error) |
| 26 | Keypad Removed |
| 28 | CE (Communication error) |
| 46 | OH4 (Motor over heat) |
| 49 | MtrSw (DI Motor Switch Fault) |
| 58 | PF(Protection error) |

## ! Danger :

Fire mode:
The drive will run at full speed either in forward or reverse direction and ignore all software protections until any one of the hardware protection is triggered or drive is damaged to achieve the requirement of smoke extraction and reduce the hazard to humans.
$>$ Each bit of 08-50 presents an input:
08-50= $0 \begin{array}{llllll} & 0 & 0 & 0 & \text { : Normal open }\end{array}$
s6 1 : Normal close
Notes:
Please set 08-48=0 (fire mode disabled) before setting normal open or normal close contact. Failure to comply may cause death or serious injury.
$>$ When $08-51=0$, motor speed setting will follow $08-52$. If the value of $08-52$ is $100 \%$, inverter output frequency will follow the value of 01-02.
> When $08-51=1$, motor speed setting will follow PID control; when fire mode is enabled, PID control will base on 10-47/10-48/10-49 (please refer the setting value of group 10)
$>$ When $08-51=2$, frequency reference will become to $4-20 \mathrm{~mA}$ (default setting of 04-00)

## 08 －59：Fire Mode Motor Direction

＞When fire mode is enabled，motor direction will base on the setting of 08－59．

## 08 －60：Fire Mode Password

＞When fire mode is enabled，use can set password in parameter 08－60，please refer the process of parameter 13－07．
＞In order to prevent the parameters of fire mode being modified，keypad display will just show the related parameters of fire mode when fire mode is enabled．（Parameter 08－48～08－60 will be read only）．
＞Parameter 08－60（password of fire mode）and 13－07（parameter password），only one parameter can be allowed to set at the same time．

| $08-53$ | PID Detection Level of Fire Mode |
| :---: | :--- |
| Range | 【0～100】\％ |
| $08-54$ | Delay Time of Fire Mode PID Loss |
| Range | 【0．0～10．0】 Sec |
| $08-55$ | PID Feedback Loss Detection Selection of Fire Mode |
|  | 【0】：Keep Running |
| Range | 【1】：Fire Mode Speed（08－52） |
|  | 【2】：Max．Output Frequency of Motor 1（01－02） |

＞When 08－51＝1，PID feedback loss detection function will be opened automatically．
$>$ When fire mode is enabled，if $08-51=1$ and then PID feedback，inverter will be stopped after the setting value of $08-54$ ．

## 08－55 PID Feedback Loss Detection Selection of Fire Mode

$>$ When $08-55=0$ ，output frequency will be fixed on current frequency．
$>$ When 08－55＝1，output frequency will be based on the setting value of parameter 08－52．
＞When 08－55＝2，output frequency will be based on the setting value of parameter 01－02．
When PID feedback value less than 08－53 and then longer than 08－54，inverter will keep running， but the frequency reference will be switched to $08-55$ ，output frequency will not less than the setting value of 08－52．

## Notes：

If there is no any feedback signal and then feedback loss level also be set to $0 \%$ ，feedback loss detection function will not be triggered．

| $\mathbf{0 8 - 5 6}$ | Detection Level of Fire Mode AI2 Signal |
| :---: | :---: |
| Range | 【0～100】\％ |
| $\mathbf{0 8 - 5 7}$ | Delay Time of Fire Mode AI2 Signal Loss |
| Range | 【0．0～10．0】Sec |
| $08-58$ | Selection of Fire Mode AI2 Signal Loss |
|  | 【0】：Keep Running |
| Range | 【1】：Fire Mode Speed（08－52） |
|  | 【2】：Max．Output Frequency of Motor 1（01－02） |

$>$ When 08－51＝2（AI2），inverter will trigger Al 2 feedback loss detection function automatically．
Selection of Fire Mode AI2 Signal Loss（08－58）：
＞When $08-58=0$ ，output frequency will be fixed on current frequency．
$>$ When $08-58=1$ ，output frequency will be based on the setting value of parameter 08－52．
$>$ When $08-58=2$ ，output frequency will be based on the setting value of parameter 01－02．

If AI2 signal is less than the setting value of $08-56$ in 360 ms ，and the time longer than setting value of $08-57$ ，the frequency reference will be considered to loss．
Analog signal will compare with the previous value at 360 ms ，if inverter ensure the frequency reference already loss，frequency reference will base on the value of 08－58．

Following is the description of the Frequency Loss Function：
When the inverter is in operation and the selected analog command source AI2 disappears，the command will operate according to the setting ratio of 08－58．

The following figure is the operating diagram of analog frequency instruction Al 2 when the frequency Instruction is lost．

Fig 4．3．76 AI2 frequency reference loss

The Modbus communication port RJ45（S＋，S－）can be used to monitor，control，program and trouble－shoot the inverter．The built－in RS－485 can support the following communication protocol：
－Modbus communication protocol
－BacNet communication protocol（Refer to section 4.7 for more details）
－MetaSys communication protocol（Refer to section 4.8 for more details）
－Pump in Parallel Connection（Refer to parameter group 23 for more details）
Modbus communication can perform the following operations，independent of the frequency command selection（00－05）setting and operation command selection（00－02）setting：

- Monitor inverter signals
- Read and write parameters.
- Reset fault
- Control multi-function inputs

## Modbus (RS-485) communication specification:

| Items | Specification |
| :--- | :--- |
| Interface | RS-485 |
| Communication type | Asynchronous (start - stop synchronization) |
| Communication parameters | Baud rate: 1200, 2400, 4800, 9600, 19200 and 38400 bps <br> Data Length: 8 bits (Fixed) <br> Parity: options of none, even and odd bit. <br> For even and odd selection stop bit is fixed at $1 \mathrm{bit}$. |
| Communication protocol | Modbus RTU / ASCII |
| Number of inverters | Maximum 31 units |

## Communication wiring and setup

(1) Turn off power to the inverter.
(2) Connect communication lines of the controller to the inverter (RJ45).
(3) Turn power on.
(4) Set the required communication parameters via the keypad.
(5) Press DSP/FUN key to go back to the main menu.
(6) If it is over the automatic return time (11-13) and DSP/FUN key is not pressed, reset the parameter and press DSP/FUN key to go back to the main menu. Or reconnect the inverter.
(7) Start communication between controller and inverter.

## Modbus (485) communication architecture

(1) Modbus communication configuration uses a master controller (PC, PLC), communicating to a maximum of 31 inverters.
(2) The master controller is directly connected to the inverter via the RS-485 interface. If the master controller has a RS-232, a converter must be installed to convert signals to RS-485 to connect the master controller to the inverter.
(3) A maximum 31 inverters can be connected to a network, following the Modbus communication standard.

## Communication Parameters:

09-00: Inverter station addresses: Range 1-31
09-02: RS-485 communication baud rate setting
= 0: 1200 bps (bits / second)
= 1: 2400 bps
= 2: 4800 bps
= 3: 9600 bps
= 4: 19200 bps

09－08：Comm．fault tolerance count
When the number of communication errors exceeds the value set in parameter 09－08 the inverter will display the comm．Fault alarm．

09－09：Wait time of inverter transmission
Sets the inverter response delay time．This is the time between the controller message and the start of the inverter response message．Refer to Fig．4．4．67．Set the controller receive time－out to a greater value than the wait time parameter（09－09）．

Figure 4．4．67 Communication Message Timing

## Group 10：PID Parameters

| $10-00$ | PID Target Value Source Setting |
| :--- | :--- |
| Range | 【0】：Keypad Given（for PUMP or HVAC mode） |
|  | 【1】：Al1 Given |
|  | 【2】：Al2 Given |
|  | 【3】：Reserved |
|  | 【4】：10－02 Given |
|  | 【5】：Reserved |
|  | 【6】：Frequency Command（00－05） |
|  | 【7】：Multi－speed Frequency Command |

Operation Pressure Setting（23－02）or Target Value of Flow Meters（PUMP or HVAC function selection） can be set as PID＇s target value only when 10－00＝0 and 23－00＝1 or 2.

When $10-00=1$ or 2 ，signal source proportional is corresponding to PID target via analog input terminal． For example， $0 \sim 10 \mathrm{~V}$ is corresponding to the target of $0 \sim 100 \%$ so given 2 V is equivalent with the target value of $20 \%$ ．

For normal use of PID，set 10－00 to 4 and set PID target value in parameter 10－02．

When $10-00=4$ ，in addtition to the percentage setting of 10－02（PID target value），it allows PID setting （12－38）in the main screen monitor．The maximum target value is set via parameter 10－33（PID maximum feedback value），the decimals are set via parameter 10－34（PID decimal width）and the unit is set via parameter 10－35（PID unit）．For example：

When $10-33=999,10-34=1,10-35=3$ and $10-02=10 \%$ ，then $12-38=9.9$ PSI displayed in the main screen monitor．User can also modify the value of $12-38$ in the main screen monitor but the maximum calue is 99.9 PSI （depending on the setting value of 10－33）．
$10-00=6$（from frequency command），it means the setpoint is the perecnetage of frequency reference corresponding to the rated frequency．（ie：setpoint $=50 \%$ ，if the frequency reference is 30 Hz and the rated frequency is 60 Hz ）．And this frequency source refers to the setting of 00－05．

When $10-00=7$ ，DI multi－speed frequency command（refer to the setting description of parameter group 3） is proportionally corresponding to PID target via multi－speed stage frequenfy setting of 05－01～05－16．

Note：Speed－stage 1 cannot set PID target value by switching auxiliary frequency via $04-05=0$ or $4-10=0$ ．

| $10-01$ | PID Feedback Value Source Setting |
| :--- | :--- |
| Range | 【1】：Al1 Given |
|  | 【2】：Al2 Given |
|  | 【3】：Reserved |
|  | 【4】：Al1－Al2 Given |

Note：Parameter 10－00 and 10－01 cannot be set to the same source．If both parameters are set to the same source the keypad will show a SE05 alarm．
Note：When AI1－Al2 is minus，it will be set to zero．

| 10－02 | PID Target Value |
| :---: | :---: |
| Range | 【0．0～100．0】 \％ |
| 10－03 | PID Control Mode |
| Range | 【xxx0b】：PID Disable <br> 【xxx1b】：PID Enable <br> 【xx0xb】：PID Positive Characteristic <br> 【xx1xb】：PID Negative Characteristic <br> 【x0xxb】：PID Error Value of D Control <br> 【x1xxb】：PID Feedback Value of D Cotrol <br> 【0xxxb】：PID Output <br> 【1xxxb】：PID Output＋Frequency Command |

PID target value source setting（10－00）／PID feedback value source setting（10－01）
Please confirm parameter 04－00 conform the need（ $0 \mathrm{~V} \sim 10 \mathrm{~V}$ or $4 \mathrm{~mA} \sim 20 \mathrm{~mA}$ ）if AI2 as PID target or PID feedback．And check the dip switch from control board to the input type（ V or I ），please refer to wiring diagram for more detail．

When 10－03 is set to $x x x 0 b$, PID will is disabled；if it is set to $x x x 1 b$, PID is enabled．

## Note：

－LCD keypad will be switched automatically（16－00）．
－Main Screen Monitoring will be changed to PID Setting（12－38）．
－$\quad$ Sub－Screen Monitoring 1 will be changed to PID Feedback（12－39）．
－Sub－Screen Monitoring 2 will be changed to Output Frequency（12－17）．
At this time，if the setting is disabled，it will be switched automatically back to frequency command as the main page．When switching to PID setting in the LED keypad，it displays the modes selection of parameter 23－05．
Note：when $23-05=0$ ，set the value in the conditions of $10-33<1000$ and $10-34=1$ ，or the inverter will display the signal of PID setting error（SE05）．

When 10－03 is set to $x x 0 x b$ ，PID output occurs forward；
When $10-03=\mathbf{x x 1 x b}$ ：PID output is reverse．PID output is chosen to reverse，If PID input is negative，the output frequency of PID will gain．On the contrary，

When 10－03 is set to $x 1 \times x b$ ，PID control for feedback differential value is enabled；if it is set to $\times 0 \times x b$ ，basic PID control is enabled．Refer to Fig．4．4．69 and Fig．4．4．70．

When 10－03 is set to $0 x x x b$ ，PID output is enabled and it is corresponding to the frequency of 01－02 at 100\％．

When $10-03$ is set to $1 \times x x b$ ，PID output and frequency command are enabled．The output percentage of frequency command（corresponding to the selected main frequency command of 00－05／00－06）will be cumulated when the inverter starts to run，and PID control starts．

| 10－26 | PID Target Acceleration／Deceleration Time |
| Range | 【0．0～25．5】 Sec |

## PID Adjustments

Gain control：The error signal（deviation）between the input command（set value）and the actual control value（feedback）．This error signal or deviation is amplified by the proportional gain（ $P$ ）to control the offset between the set value and the feedback value．

Integral control: The output of this control is the integral of the error signal (difference between set value and feedback value) and is used to minimize the offset signal that is left over from the gain control. When the integral time (I) is increased, the system response becomes slower.

Differential control: This control is the inverse from integral control and tries to guess the behavior of the error signal by multiplying the error with the differential time. The result is added to the PID input. Differential control slows down the PID controller response and may reduce system oscillation.
Note: Most applications that PID control (fan and pump) do not require differential control.
Refer to Fig. 4.4.68 for PID control operation

Figure 4.4.68 PID Control

## PID Control Type

The inverter offers two types of PID control:
(a) PID control with differential feedback: (10-03 = x1xxb)

Make sure to adjust the PID parameters without causing system instability. Refer to Fig. 4.4.69 for PID control for feedback value differential.

Figure 4.4.69 PID control for feedback differential value
(b) Basic PID control: (10-03 $=x 0 x x b)$

This is the basic type of PID control. Refer to the Fig. 4.4.70.

Feedback
Figure 4.4.70 Basic PID control

## PID Setup

Enable PID control by setting parameter 10-03, PID target value (10-00) and PID feedback value (10-01).

## 10-00: PID target value

= 0: keypad given
= 1: analog Al1 given (default)
= 2: analog Al2 given
= 3: Reserved
= 4:10-02
10-01: PID feedback value
= 1: Analog Al1 given
= 2: Analog Al2 given
= 3: Reserved

Figure 4.4.71 PID input selection

## PID Control Setting

PID control block diagram.

The following figure shows the PID control block diagram.

Figure 4.4.72 PID control block diagram

## PID Tuning

Use the following procedures to start PID control,
(1) Enable PID control (set 10-03 to a value greater than "xxx0b").
(2) Increase the proportional gain (10-05) to the highest value possible without causing the system to become unstable.
(3) Decrease the integral time (10-06) to the lowest value possible without causing the system to become unstable.
(4) Increase the differential time (10-07) to the highest value possible without causing the system to become unstable.

The PID control serves to maintain a given process within certain limits whether it is pressure, flow etc. To do this the feedback signal is compared to the set value and the difference becomes the error signal for the PID control.

The PID control then responds by trying to minimize this error. The error is multiplied times the value of the proportional gain set by parameter 10-05. An increased gain value results in a larger error. However, in any system as the gain is increased there is a point that the system will become unstable (oscillate).

To correct this instability, the response time of the system may be slowed down by increasing the Integral time set by parameter 10-06. However slowing the system down too much may be unsatisfactory for the process.

The end result is that these two parameters in conjunction with the acceleration time (01-14) and deceleration (01-15) times require to be adjusted to achieve optimum performance for a particular application.

PID output polarity can be selected with parameter 10-03 (setting $=x x 0 x b$ : PID output forward, setting $=$
xx1xb: PID output reversal). When the PID output is set for reverse operation the output frequency decreased when the PID target value increases.

PID feedback value can be adjusted using parameter 10-04 (PID feedback gain) as well as with the analog input gain and bias for terminal Al1 or AI2.

10-14: PID integral limit: Used to limit the integral output to prevent motor stall or damage to the system in case of a rapid change in the feedback signal. Reduce the value of 10-14 to increase the inverter response.

10-23: PID limit: Used to limit the output of the PID control. Maximum output frequency is $100 \%$.

10-10: Primary delay time: Low pass filter situated after the PID limit block that can be used to prevent PID output resonance. Increase the time constant to a value greater than the resonance frequency cycle and reduce time constant to increase the inverter response.

10-09: PID bias: Used to adjust the offset of the PID control. The offset value is added to the frequency reference as compensation. Use parameter 10-24 (PID output gain) to control the amount of compensation.

In case the PID control output value goes negative, parameter 10-25 (PID reversal output selection) can be used to reverse the motor direction.

Note: The PID output remains at zero when reverse operation is disabled.

10-26: PID target SFS: Sets the PID target value acceleration and deceleration ramp time. The PID target SFS can be disabled by setting the multi-function digital inputs 03-00 ~ 03-05 to 36 (PID target SFS is off). Reduce the acceleration / deceleration time in case load resonance or system instability is encountered.

## PID Fine Tuning

All PID control parameters are related to each other and require to be adjusted to the appropriate values. Therefore, the procedure achieving the minimum steady-state is shown as following:
(1) Increase or decrease the proportion ( $P$ ) gain until the system is stable using the smallest possible control change.
(2) The integral (I) reduces the system stability which is similar to increasing the gain. Adjust the integral time so that the highest possible proportional gain value can be used without affecting the system stability. An increase in the integral time reduces system response.
(3) Adjust the differential time if necessary to reduce overshoot on startup. The acceleration / deceleration time can also be used for the same purpose.

Fine-tuning PID control parameters:
(1) Reduce overshoot

In case overshoot occurs, reduce the derivative time (D) and increase the integral time (I).
（2）Stabilize PID control

（3）Reduce long－period oscillation

（4）Reduce short－period oscillation

To quickly stabilize the PID control，reduce the integral time（I）and increase the differential time（D） in case overshoot occurs．

Adjust the integral time（I）in case of long－periodical system oscillation．

Adjusting the differential time（D）and proportional（P） gain when experiencing short－periodical oscillation．

| 10－11 | PID Feedback Loss Detection Selection |
| :---: | :---: |
| Range | 【0】：Disable <br> 【1】：Warning <br> 【2】 ：Fault |
| 10－12 | PID Feedback Loss Detection Level |
| Range | 【0～100】 \％ |
| 10－13 | PID Feedback Loss Detection Time |
| Range | 【0．0～10．0】 Sec |

The PID control function provides closed－loop system control．In case PID feedback is lost，the inverter output frequency may be increase to the maximum output frequency．

It is recommended to enable to the PID feedback loss when the PID function is used．

## PID feedback loss detection

10－11＝0：Disable
10－11＝1：Warning
A feedback loss condition is detected when the PID feedback value falls below the value set in parameter 10－12（PID feedback loss detection level）for the time set in parameter 10－13（PID feedback loss detection time）．PID feedback loss warning message＂Fb＂will be displayed on the keypad and the inverter will continue to operate．

## 10－11＝2：Fault

A feedback loss condition is detected when the PID feedback value falls below the value set in parameter 10－12（PID feedback loss detection level）for the time set in parameter 10－13（PID feedback loss detection time）．PID feedback loss fault message＂Fb＂will be displayed on the keypad，the inverter stops and the fault contact is activated．

Figure 4．4．73 PID feedback loss detection

| $10-17$ | ＊Start Frequency of PID Sleep |
| :---: | :--- |
| Range | 【0．00～599．00】 Hz |
| $10-18$ | Delay Time of PID Sleep |
| Range | 【0．0～255．5】 Sec |
| $10-19$ | ＊Frequency of PID Waking up |
| Range | 【0．00～599．00】 Hz |
| $10-20$ | Delay Time of PID Waking up |
| Range | 【0．0～255．5】Sec |
| $10-29$ | PID Sleep Selection |
| Range | 【0】：Disable <br>  <br> $10-40$ <br> 【2】：Enable <br> Range |
| Compensation Frequency Selection of PID Sleep |  |

The PID Sleep function is used to stop the inverter when the PID output falls below the PID sleep level （10－17）for the time specified in the PID sleep delay time parameter（10－18）．

The inverter wakes up from a sleep condition when the PID output（Reference frequency）rises above the PID wake－up frequency（10－19）for the time specified in the PID wake－up delay time（10－20）．

Use parameter 10－29 to enable／disable PID sleep function．
10－29＝0：PID Sleep function is disabled．
10－29＝1：PID sleep operation is based on parameters of 10－17 and 10－18．
10－29＝2：PID sleep mode is enabled by multi－function digital input

Refer to Fig．4．4．74（a），（b）and（c）for PID sleep／wakeup operation．
Note：Parameter 10－17 is the general start frequency of PID sleep，and it is not applied to the sleep frequency of constant pressure（parameter 23－10）by PUMP．

[^3]

Figure 4.4.74: (a) PID control bock diagram

Figure 4.4.74: (b) Timing diagram PID sleep / wakeup

Figure 4.4.74: (c) Timing diagram of PID sleep compensation frequency/ wakeup

## Notes:

- Refer to Fig. 4.4.74: (b) for parameter $10-40=0$. The PID sleep timer is enabled when the output frequency (Fout) falls below the PID sleep frequency (10-17). When the sleep timer reaches the set PID sleep delay time (10-18) the inverter will decelerate to a stop and enter the sleep mode.
- Refer to Fig.4.4.74: (c) for parameter 10-40=1. The PID sleep timer is enabled when the output frequency (Fout) falls below the PID sleep frequency (10-17). The output frequency changes with the reference frequency (Fref) when the sleep timer reaches the set PID sleep delay time (10-18), the motor will run gradually to PID sleep frequency set by 10-17. (It is applicated in the occasion of fixed frequency.)
- While sleep mode is active and the motor has stopped, the internal PID control is still in operating. When the reference frequency increases and exceeds the wakeup frequency parameter 10-19 for the time specified in the wakeup delay time parameter 10-20, the inverter will restart and the output frequency will ramp up to the reference frequency.
Ex:
If wakeup frequency < sleep frequency, start upon sleep frequency and the inverter gets into sleep mode by wakeup frequency.
If wakeup frequency > sleep frequency, start upon wakeup frequency and the inverter gets into
sleep mode by sleep frequency．
Ex1：
Sleep mode is only allowed in positive direction and if 10－25＝1（Allow Reversal Output），the sleep mode needs to be turned off．
－Parameter 10－00 and 10－01 can not be set in the same source．If they are set in the same value， ＂SE05＂（PID selection error message）will be displayed in the keypad．
－When PID sleep selection is enabled or set by DI （10－29＝ 1 or 2 ）and PID reversal output selection （10－25）＝1（allow reversal output），＂SE05＂（PID selection error message）will be displayed in the keypad．
－When PID sleep selection is enabled ot set by DI（10－29＝1or 2 ）and PID control mode（10－03）＝ 1xxxb，＂SE05＂（PID selection error message）will be displayed in the keypad．
Note：When 23－00＝1（Pump），if PID sleep disable，most pump function will be affected．

| $10-27$ | PID Feedback Display Bias |
| :---: | :--- |
| Range | $【 0 \sim 9999 】$ |

## PID Feedback Display Scaling

The PID feedback signal can be scaled to represent actual engineering units．Use parameter 10－33 to set the feedback signal gain for the feedback signal range maximum and parameter 10－27 to the feedback signal minimum．

Example： $0-10 \mathrm{~V}$ or $4-20 \mathrm{~mA}$ feedback will be displayed as pressure，use $10-27$ to set the pressure for 0 V or 4 mA feedback signal and use $10-33$ to set the pressure for 10 V or 20 mA ．

Refer to the Fig．4．4．75 for displaying the unit conversion．

Figure 4．4．75 Feedback signal scaling
Example：Feedback signal：$\quad \mathrm{OV}=0 \%=1.0 \mathrm{PSI}$
$10 \mathrm{~V}=100 \%=20.0 \mathrm{PSI}$
Parameter setting：10－27＝ 10 （ $0 \%$ feedback）
10－33＝ 200 （100\％feedback）

| $10-30$ | Upper Limit of PID Target |
| :---: | :--- |
| Range | $【 0 \sim 100 】 \%$ |
| $10-31$ | Lower Limit of PID Target |
| Range | $【 0 \sim 100 】 \%$ |

PID target value will be limited to the upper and lower limit range of PID target．

| $10-32$ | PID Switching Function |
| :---: | :--- |
| Range | 【0】：PID1 |
|  | 【1】：PID2 |

|  | 【2】：Set by DI |
| :--- | :--- |
|  | 【3】：Set by RTC |

10－32＝0：PID 1 function is enabled．

PID target value is set by 10－02 and proportional gain，integral time and differential time are set by 10－05， 10－06 and 10－07．

10－32＝1：PID 2 function is enabled．

PID target value is set by 10－02 and proportional gain，integral time and differential time are set by 10－36， $10-37$ and 10－38．

10－32＝2：Set by Digital Input

If the digital input terminal is enabled（digital multi－function terminal is set to 54），PID1 will switch to PID2．

10－32＝3：Set by RTC

When RTC timer is enabled，PID1 will switch to PID2．

| $10-33$ | PID Maximum Feedback Value |
| :--- | :--- |
| Range | $【 1 \sim 10000 】$ |

Function of PID maximum feedback value is the $100 \%$ corresponding value of 10－02．

| $10-34$ | PID Decimal Width |
| :---: | :--- |
| Range | $【 0 \sim 4 】$ |

Function of PID decimal width enables the user to set the decimal point．
For example，if it is set to 1 ，the keypad displays the first decimal place XXX．X．If it is set to 2 ，the keypad displays the second decimal place $\mathrm{XX} . \mathrm{XX}$ ．

| $10-35$ | PID Unit（Only display in LCD Keypad） |
| :---: | :---: |
| Range | 【0～24】 |

PID unit enables the user to select the unit for PID target vaule．
When $10-35=0$ ，parameter of $12-38$ will be used by the unit of $\%$ ．

| $10-36$ | PID2 Proportional Gain（P） |
| :---: | :--- |
| Range | $【 0.00 \sim 10.00 】$ |
| $10-37$ | PID2 Integral Time（I） |
| Range | $【 0.0 \sim 100.0 】$ Sec |
| $10-38$ | PID2 Differential Time（D） |
| Range | $【 0.00 \sim 10.00 】$ Sec |

Refer to the PID function for more details of PID2 description．

| Range | 【0．00～599．00】 Hz |
| :---: | :--- |

＊1：It is new added in inverter software V1．4．
＊：（When the motor＇s maximum output frequency is over than 300 Hz ，the frequency resolution is 0.1 Hz ．）

When the warning of PID feedback disconnection occurs（10－11＝1），frequency command output depends on the parameter 10－39．When the disconnection warning is removed，PID control restores．

| $10-44$ | Precharge Frequency |
| :---: | :--- |
| Range | $【 0 \sim 120.0 】 \mathrm{~Hz}$ |
| $10-45$ | Precharge Time |
| Range | $【 0 \sim 250 】$ Sec |
| $10-46$ | Precharge Target Level |
| Range | $【 0 \sim 10000 】$ |

When parameter 10－44 is set to precharge frequency and PID control mode is set to be 10－03＝XXX1B （PID enable），the inverter runs by the precharge frequency and stops by the end of precharge time set by parameter 10－45．When the precharge time stops，the inverter runs by PID control．If PID feedback signal is equal or higher than the level of precharge target（parameter 10－46），it is not required to wait for the end of precharge time and the inverter can run by PID control．Refer to the following figure．

The setting description of parameter $10-00=4$ can be referred by parameter $10-46$ ．According to the the setting value of parameter 10－33，change the upper limit of setting value（parameter 10－46），determine the decimal places（parameter 10－34）and unit display（parameter 10－35）．

| $10-47$ | Proportioanl Gain（P）of Fire Mode |
| :---: | :--- |
| Range | $【 0.00 \sim 10.00 】$ |
| $10-48$ | Integral Time（I）of Fire Mode |
| Range | $【 0.0 \sim 100.0 】$ Sec |
| $10-49$ | Differential Time（D）of Fire Mode |
| Range | $【 0.00 \sim 10.00 】$ Sec |

$>$ PID functions of ire mode，please refer to parameter group 08.

## Group 11：Auxiliary Parameters

| $11-00$ | Direction Lock Selection |
| :---: | :--- |
| Range | 【0】：Allow Forward and Reverse Rotation |
|  | 【1】：Only Allow Forward Rotation |
|  | 【2】：Only Allow Reverse Rotation |

If motor operation direction is set to 1 or 2 ，the motor can only operate in that specific direction．Run commands in the opposite direction are not accepted．

Forward or reverse commands can be issued via the control terminals or keypad．

Note：The reverse rotation selection can be used in fan and pump application where reverse rotation is prohibited．

| $11-01$ | Carrier Frequency |
| :---: | :--- |
| Range | 【0】：Carrier Output Frequency Tuning <br> 【1～16】 KHz |

## Notes：

（1）Value 1 to 16 represents KHz ．
（2）When 11－01＝0，variable carrier frequency is used see parameter 11－30～11－32．
（3）For SLV mode，the minimum value of $11-01$ is 2 kHz ，due to the sample rate，suggest to use 4 KHz ， and the motor cable used within 100 m ．
（4）Setting range is determined by the inverter rating（13－00）．
（5）Refer to section 3 inverter derating based on carrier frequency．
（6）A low carrier frequency increases motor noise but reduces motor losses and temperature．
（7）A low carrier frequency decreases RFI，EMI interference and motor leakage current．
Refer to the carrier frequency Table 4．4．11．
Table 4．4．11 Carrier frequency settings

| Carrier frequency | $1 \mathrm{KHz}-6 \mathrm{KH}-10 \mathrm{KHz}-16 \mathrm{KHz}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Motor noise | High |  |  | low |
| Output current waveform（similar to sinusoidal wave） | Bad | －－－－－－ | Good－－－－－－－ | Bad |
| Noise interference | Low | －－－－ | －－－－－－－－－－－－ | high |
| Leakage current | Low |  | －－－－－－－－ | high |
| Heat losses | Low | －－－－－－ | －－－－－－－ | high |

If wire length between the inverter and the motor is too long，the high－frequency leakage current will cause an increase in inverter output current，which might affect peripheral devices．Adjust the carrier frequency to avoid this as shown in Table 4．4．12．

Table 4．4．12 Wire length and carrier frequency

| Wire length | ＜ $\mathbf{3 0}$ Meter（98ft） | up to $\mathbf{5 0}$ Meter <br> $(164 \mathrm{ft})$ | up to $\mathbf{1 0 0}$ Meter <br> $(328 \mathrm{ft})$ | $>\mathbf{1 0 0}$ Meter <br> $>328 \mathrm{ft}$ |
| :---: | :---: | :---: | :---: | :---: |
| Carrier frequency <br> $(11-01$ value） | Max．value 16 KHz <br> $(11-01=16 \mathrm{KHz})$ | Max．value 10 KHz <br> $(11-01=10 \mathrm{KHz})$ | Maxi．value 5 KHz <br> $(11-01=5 \mathrm{KHz})$ | Max．value 2 KHz <br> $(11-01=2 \mathrm{KHz})$ |

## Notes：

－Reduce the carrier frequency if the torque does not match the speed．
－In V／F control mode，the carrier frequency is determined by parameters 11－30（Carrier frequency max．limit），11－31（Carrier frequency lower limit）and 11－32（Carrier frequency proportional gain） after parameter 11－01 is setted to be 0 ．

| $11-02$ | Soft PWM Function Selection |
| :---: | :--- |
| Range | 【0】：Disable |
|  | 【1】：Soft PWM 1 |
|  | 【2】：Soft PWM 2 |

11－02＝0：Soft－PWM control disabled．

11－02＝1：Soft－PWM control enabled．Soft－PWM 1 control can reduce the＇metal＇noise produced by the motor，more comfortable for the human ear．At the same time，Soft－PWM also limits RFI noise to a minimum level．The default setting of Soft－PWM control is disabled．When Soft－PWM 1 is enabled，the maximum carrier frequency is limited to 8 kHz ．

When 11－02＝2（Soft PWM 2 enables），users adjusts 2 Phase／ 3 Phase PWM Switch Frequency （parameter 11－66），detection range at Soft PWM function 2 （parameter 11－67），and detecting start frequency at Soft PWM function 2 （parameter 11－68）by the sensitivity to the sound．

| $11-66$ | 2 Phase／3 Phase PWM Switch Frequency |
| :---: | :--- |
| Range | $【 6.00 \sim 60.00 】$ |

When the inverter＇s output frequency is higher than the setting value of parameter 11－66，the modulation mode will be switched．

| $11-67$ | Detection Range at Soft PWM Function 2 |
| :---: | :--- |
| Range | $【 0 \sim 12000 】$ |
| $11-68$ | Detecting Start Frequency at Soft PWM Function 2 |
| Range | $【 6.00 \sim 60.00 】$ |

When the inverter＇s output frequency is higher than the setting value of parameter 11－68，the inverter starts the function of noise detection and it adjusts electromagnetic noise coming from the motor run upon the setting value of parameter 11－67．

Note：When 11－02＝2，the sum values of parameter 11－01 and parameter 11－67 can not be higher than the inverter＇s upper limit of carrier．For the inverter＇s proper run，there is affecting mechanism among these parameters（11－01，11－02 and 11－67）．
a）If the error occurs in setting value of parameter 11－01，it is because parameter 11－02＝2 and the setting value of parameter 11－01＋that of parameter 11－67＞upper limit of the inverter＇s carrier frequency．Thus，adjust the setting value of parameter 11－02 or that of parameter 11－67．
b）If the error occurs in setting value of parameter 11－67，it is because parameter 11－02＝2 and the setting value of parameter 11－01＋that of parameter 11－67＞upper limit of the inverter＇s carrier frequency．Thus，adjust the setting value of parameter 11－02 or that of parameter 11－01．
c）When 11－02＝2，the error occurs in setting value of parameter 11－01 or parameter 11－67． Please check the setting values of parameter 11－01＋that of parameter 11－67＞upper limit of the inverter＇s carrier frequency．
d）If the error occurs in setting parameter 11－02＝2，it is because the setting value of parameter 11－01＋that of parameter 11－67＞upper limit of the inverter＇s carrier frequency．Thus，adjust the setting value of parameter 11－01 or that of parameter 11－67．Then set parameter 11－02 $=2$ ．

| $11-03$ | Automatic Carrier Lowering Selection |
| :---: | :--- |
| Range | 【0】：Disable |
|  | 【1】：Enable |

11－03＝0：Automatic carrier frequency reduction during an overheat condition is disabled．
11－03＝1：Carrier frequency is automatically lowered in case the inverter heatsink overheats and returns to carrier frequency set in parameter 11－01 when the inverter temperature returns to normal．See section 3.5 for more information．

| $11-04$ | S－curve Time Setting at the Start of Acceleration |
| :---: | :--- |
| $11-05$ | S－curve Time Setting at the End of Acceleration |
| $11-06$ | S－curve Time Setting at the Start of Deceleration |
| $11-07$ | S－curve Time Setting at the End of Deceleration |
| Range | $【 0.00 \sim 2.50 】$ Sec |

The $S$ curve function for acceleration／deceleration is used to reduce mechanical impact caused by the load during momentary starting and stopping of the inverter．To use the $S$ curve function set the time for acceleration start point（11－04），acceleration end point（11－05），deceleration start point（11－06）and deceleration end point（11－07）．Refer to Fig．4．4．76 for more information．

Figure 4．4．76 S curve characteristic
Total acceleration and deceleration time when the S curve is used：
Accelerating time $=$ Accelerating time $1($ or 2$)+\frac{(11-04)+(11-05)}{2}$
Deceleration time $=$ Deceleration time $1($ or 2$)+\frac{(11-06)+(11-07)}{2}$

| $11-08$ | Jump Frequency 1 |
| :---: | :--- |
| $11-09$ | Jump Frequency 2 |
| $11-10$ | Jump Frequency 3 |
| Range | $【 0.0 \sim 599.0 】 \mathrm{~Hz}$ |
| $11-11$ | Jump Frequency Width |
| Range | $【 0.0 \sim 25.5 】 \mathrm{~Hz}$ |

These parameters allow＂jumping over＂of certain frequencies that can cause unstable operation due to resonance within certain applications．

Note：Prohibit any operation within the jump frequency range．During acceleration and deceleration the frequency is continuous without skipping the jump frequency．

To enable jump frequency $1-3(11-08-11-10)$ set the frequency to a value greater than 0.0 Hz ．
Use the jump frequency width（11－11）to create a jump frequency range．Refer to Fig．4．4．77．

Figure 4．4．77 Jump frequency operation

## Jump frequency via Analog Input．

Set parameter 04－05（Al2 function selection）or 04－10（Al2 function selection）to 9 （frequency jump setting 4）for controlling the jump frequency via analog input AI2．Refer to Fig．4．4．38．

Note：When jump frequency overlap the sum of the overlapped jump frequencies will be used as the jump frequency range．Refer to Fig．4．4．78．

Figure 4．4．78 Jump frequency overlap

| $11-13$ | Automatic Return Time |
| :--- | :--- |
| Range | $【 0 \sim 120 】$ Sec |

If the keypad is not pressed within the time set by $11-13$ ，it will automatically return to the mode screen．

When it is set to 0 ，function of automatic return key is off．Press the return key to return to the previous directory．

| $11-12$ | Manual Energy Saving Gain |
| :---: | :--- |
| Range | $【 0 \sim 100 】 \%$ |
| $11-18$ | Manual Energy Saving Frequency |
| Range | $【 0.00 \sim 599.00 】 \mathrm{~Hz}$ |

Manual energy savings reduces the output voltage for the purpose of saving energy．

To enable manual energy savings set one of the multi－function digital input（03－00 to 03－05）to 20 and activate the input or use parameter 11－18 to set the manual energy savings activation frequency．

When the output frequency rises above the value set in parameter 11－18 manual energy savings function is enabled．Setting parameter $11-18$ manual energy savings frequency to 0.0 Hz disables the manual
energy savings frequency activation function．Refer to figure 4．4．88 for more information．
Note：Only use manual energy savings functions in combination with light loads．
Manual energy saving gain（11－12）determines the output voltage of the inverter when manual energy savings is enabled．Output voltage is percentage gain times the V／F voltage．

Manual energy saving control uses the voltage recovery time（07－23）to change the output voltage

Figure 4．4．79 Manual energy saving operation

| $11-19$ | Automatic Energy Saving Function |
| :--- | :--- |
| Range | 【0】 ：Automatic Energy Saving is Disabled． <br> 【1】 ：Automatic Energy Saving is Enabled． |
| $11-20$ | Filter Time of Automatic Energy Saving |
| Range | 【0～200】 msec |
| $11-21$ | Voltage Upper Limit of Energy Saving Tuning |
| Range | 【0～100】\％ |
| $11-22$ | Adjustment Time of Automatic Energy Saving |
| Range | 【0～5000】 msec |
| $11-23$ | Detection Level of Automatic Energy Saving |
| Range | 【0～100】\％ |
| $11-24$ | Coefficient of Automatic Energy Saving |
| Range | 【0．00～655．34】 |

In the V／F control mode the automatic energy saving（AES）function automatically adjusts the output voltage and reduces the output current of the inverter to optimize energy savings based on the load．The output power changes proportional to the motor load．Energy savings is minimal when the load exceeds $70 \%$ of the output power and savings become greater when the load decreases．

AES function is suitable for the load is stable，just like fan or windmill．If the load is variable，please do not use this function to avoid the output torque is not enough．

The parameter of automatic energy saving function has been set at the factory before shipment．In general， it is no need to adjust．If the motor characteristic has significant difference from the TECO standard，please refer to the following commands for adjusting parameters：

## Enable Automatic Energy Savings Function

（1）To enable automatic energy saving function set 11－19 to 1.
（2）Filter time of automatic energy saving（11－20）
（3）Commissioning parameter of energy saving（11－21 to 11－22）
In AES mode，the optimum voltage value is calculated based on the load power requirement but is also affected by motor temperature and motor characteristic．

In certain applications the optimum AES voltage needs to be adjusted in order to achieve optimum energy savings. Use the following AES parameters for manual adjustment:

11-21: Voltage limit value of AES commissioning operation

Set the voltage upper limit during automatic energy saving. 100\% corresponds to the settings of parameter 01-03 (Maximum Output Voltage) depending on the inverter class used. Refer to the Fig.4.4.80.

Figure 4.4.80 Voltage limit value of commissioning operation

11-22: Adjustment time of automatic energy saving
Set sample time constant for measuring output power.
Reduce the value of 11-22 to increase response when the load changes.
Note: If the value of 11-22 is too low and the load is reduced the motor may become unstable.

11-23: Detection level of automatic energy saving
Set the automatic energy saving output power detection level.

11-24: Coefficient of automatic energy saving
The coefficient is used to tune the automatic energy saving. Adjust the coefficient while running the inverter on light load while monitoring the output power. A lower setting means lower output voltage.

## Notes:

- If the coefficient is set to low the motor may stall.
- Coefficient default value is based on the inverter rating. Set parameter 13-00. If the motor power does not match the inverter rating.

| $11-29$ | Auto De－rating Selection |
| :---: | :--- |
| Range | 【0】：Disable |
|  | 【1】：Enable |

The automatic de－rating function automatically reduces the output frequency by $30 \%$ of the nominal motor speed when the inverter detects an overheat condition（heatsink）．

Automatic de－rating function depends on the automatic carried frequency reduction selection（11－03）．
If automatic carrier frequency reduction is disabled（11－03＝0），the output frequency is reduced by $30 \%$ of the nominal motor speed when an overheat condition is detected．

If automatic carrier frequency reduction is enabled（11－03＝1），the output frequency is reduced by $30 \%$ of the nominal motor speed when the carrier frequency is at its minimum setting．
$\mathbf{1 1 - 2 9}=\mathbf{0}$ ：Auto de－rating selection disabled，carrier frequency is based on 11－01 or 11－03．

11－29＝1：Auto de－rating selection is enabled．

| $11-30$ | Variable Carrier Frequency Max．Limit |
| :--- | :--- |
| Range | 【2～16】 KHz |
| $11-31$ | Variable Carrier Frequency Min．Limit |
| Range | 【1～16】 KHz |
| $11-32$ | Variable Carrier Frequency Proportional Gain |
| Range | 【00～99】 |

Carrier frequency method depends on the selected control mode．

| Control Mode | Variable Carrier Frequency <br> $(\mathbf{1 1 - 0 1}=\mathbf{0})$ | Fixed Carrier Frequency <br> $(11-\mathbf{0 1}=\mathbf{2 - 1 6 ~ k H z})$ |
| :---: | :---: | :---: |
| V／F | Available | Available |
| SLV | Not available | Available |

Variable carrier frequency can be adjust with parameter 11－30～11－32．

$K$ is a coefficient；the value of $K$ is based on the following based on the maximum carrier frequency：
$\mathrm{K}=1$ ：when $11-30<5 \mathrm{KHz}$
$\mathrm{K}=2$ ：when $10 \mathrm{KHz}>11-30 \geq 5 \mathrm{KHz}$
$\mathrm{K}=3$ ：when $11-30 \geq 10 \mathrm{KHz}$

## Notes：

－In V／F control mode if the speed and torque are constant，the variable carrier frequency mode（11－01＝0） can be selected to reduce the carrier frequency based on output frequency．
－If the carrier frequency proportional gain（11－32）＞ 6 and 11－30＜11－31，error message＂SE01＂out of range will appear on the keypad．
－If the minimum limit（11－31）is set higher than the maximum limit（11－30），the minimum limit will be ignored and the carrier frequency will be set at the highest limit（11－30）．
－In fixed carrier frequency mode（11－01＝2－16）parameters 11－30，11－31 and 11－32 are not used．
－In SLV control mode，the maximum limit of the carrier frequency is fixed at 11－30．

| $11-28$ | Frequency Gain of Overvoltage Prevention 2 |

＊（When the output frequency is bigger than 300 Hz ，the resolution is 0.1 Hz ）
Overvoltage suppression is used for the application of likely causing to energy recharge．
Example：there are two situations causing excessive energy to recharge the inverter in stamping application
（1）When cam clutch is not engaged，the motor will accelerate and start flywheel．When motor decelerates， the rotation speed will higher than motor speed owing to the large flywheel＇s inertia and then recharge the inverter．
（2）When cam clutch is engaged，the motor will start flywheel and compress the spring．When the highest point of the cam moves beyond its center，the spring will release the power to the flywheel and excessive energy output recharge the inverter．

Figure 4.4.80.a Stamping Operation
Over-voltage prevention (OVP) function monitors the DC-bus voltage and adjusts the speed reference, acceleration and deceleration rate, to prevent the inverter from tripping on an overvoltage.

When the speed reference is reduced, the motor will start to decelerate. When the inverter is operating at a fixed output frequency and excessive regenerative energy back to the inverter is detected the inverter will accelerate the motor in order to reduce the DC-bus voltage. Refer to figure 4.4.80.b.

Figure 4.4.80.b operation

When $11-40=1$ : OV prevention Mode 1

1) $D C$ voltage filter is used to provide a stable reference value for determining the change in $D C$ voltage change during regenerative operation.

- Adjust the DC voltage filtering increase rate parameter 11-33 (DC Voltage Filter Rise Amount). When the DC voltage exceeds 11-33+11-35 (DC Voltage Filter Deadband Level), the output of the filter will increase.
- Adjust the DC voltage filtering decrease rate parameter 11-34 (DC Voltage Filter Fall Amount). When the DC voltage exceeds 11-33+11-35 (DC Voltage Filter Deadband Level), the output of the filter will decrease.
- Monitor the DC voltage filter output by 12-20 (DC voltage filter value).
- Set the DC voltage filter decrease rate (11-34) to a greater value than the value of the DC voltage filtering increase rate (11-33).

2) When the inverter is operation at a fixed output frequency, the OVP function will monitor the DC-bus voltage to detect regenerative operation.

In case of a regenerative condition the inverter calculates the delta DC bus voltage value and multiplies the value with parameter 11-36, the result is added to the frequency reference accelerating the motor to prevent on an overvoltage condition.

When the regenerative energy decreases, the inverter output frequency will return to the actual frequency reference. Deceleration rate is based on the DC voltage, as shown in Figure 4.4.80.c.

Figure 4.4.80.c OVP deceleration time
3) When the inverter is stopped, the deceleration rate can be set with parameter 00-15 (Tdec1). In case the DC voltage is too high, the inverter will decelerate based on the OVP deceleration time as shown in Figure 4.4.92.

- Set DC-bus voltage in parameter 11-38 (start voltage of OVP deceleration) and set OVP deceleration rate in 00-22 (Tdec3).
- When the DC voltage reaches this level, it is necessary to decelerate rapidly in order to prevent the delta DC voltage of becoming too large.
- When DC voltage reaches the setting of 11-39 (stop voltage of OVP deceleration), it will decelerate based on the set value of 00-24 (Tdec4)
- Deceleration rate is linear based on the slope defined by the start point (11-38) and end point (11-39).
4). Enable the OVP function with parameter 11-40 set to 1 or 2 . The following parameter default values will be changed when the OVP function is enabled:
$00-14$ (Tacc1)= $5.0 \mathrm{Sec}($ (the frequency reference acceleration rate when DC voltage is too high.)
$00-22$ (Tdec3) $=20.0 \mathrm{Sec}$ (low setting point of OVP deceleration rate).
$00-24($ Tdec 4$)=100.0 \mathrm{Sec}($ high setting point of OVP deceleration rate).
Note: S curve should be disabled when using the OVP function (11-04~11-07=0.0sec).

The process of OV prevention mode 2 is the same as that of OV prevention mode 1 but it strengthens more the part of DC BUS over the deceleration stop voltage of OV prevention（11－39）in Fig．4．4．80．c．It can accelerate frequency compensation to avoid OV protection by increasing frequency gain of OV prevention 2 （11－28）．

| $11-64$ | Acceleration Speed Gain Adjustment |
| :--- | :--- |
| Range | $\lfloor 0.1 \sim 10.0 】$ |
| $11-65$ | Target Main Circuit Voltage |
| Range | $200 \mathrm{~V}: 【 200 \sim 400 】 \mathrm{~V}$ <br>  $\mathrm{400V:【400} \mathrm{\sim 800】V}$ |

When 11－40 $=3$（OV Prevention Mode 3），user can temporarily increase output frequency to avoid OV occurring and it will be not higher than the maximum output frequency of motor 1 ．Thus，adjust parameter 01－02（maximum output frequency of motor 1）depending on the application．

Adjustment modes
If OV still occurs in OV prevention mode 3，increase the setting value of parameter 11－64 in 0.1 units． When the setting value of parameter $11-64$ is higher，the speed and the current increase more．

| $11-41$ | Reference Frequency Loss Detection |
| :---: | :--- |
| Range | 【0】：Deceleration to Stop when Reference Frequency Disappears <br> 【1】：Operation is Set by 11－42 when Reference Frequency Disappears |
| $11-42$ | Reference Frequency Loss Level |
| Range | $【 0.0 \sim 100.0 】 \%$ |

A reference frequency loss is detected when the frequency command falls $90 \%$ within 360 ms ．
When 11－41＝1，main frequency command continuously compares with the previous value occurring in 360 ms．

When the frequency loss occurs，inverter will operate depending on the following estimated frequency command．

Frequency command after frequency loss $=$ the maximum output frequency of motor $1(01-02) \times$ the level set in parameter 11－42

Descriptions of frequency loss function：
1）When inverter is on operation and source of selected analog command disappears，the command acts depending on the setting of parameter 11－42．

2）When reference command restores to the level prior to frequency loss，inverter will restore to the previous state．

## Notes：

1．Frequency command（11－42）is corresponding to the maximum output frequency of motor 1 （01－02） when reference frequency disappears．
2．The disappearance of reference frequency is only for the use of analog signal（1：Al1；7：Al2）from the selection of main frequency source（00－05）．

Refer to Fig．4．4．81 for the process diagram of multi－function digital output（03－11～03－12）when reference frequency loss occurs．

Figure 4．4．81 Operation for reference frequency loss

| $11-43$ | Hold Frequency at Start |
| :---: | :--- |
| Range | $【 0.0 \sim 599.0 】 \mathrm{~Hz}$ |
| $11-44$ | Frequency Hold Time at Start |
| Range | $【 0.0 \sim 10.0 】$ Sec |
| $11-45$ | Hold Frequency at Stop |
| Range | $【 0.0 \sim 599.0 】 \mathrm{~Hz}$ |
| $11-46$ | Frequency Hold Time at Stop |
| Range | $【 0.0 \sim 10.0 】$ Sec |

The hold function is used to temporarily hold the reference frequency in order to prevent stalling the motor or preventing an over current condition during starting or stopping due to load conditions．

During start the inverter will operate at the hold frequency at start for the time specified in the parameter 11－44 in order to establish the magnetic flux．

Note：The acceleration of deceleration time does not include the start and stop hold time．Refer to the Fig． 4．4．82．

Figure 4．4．82 Reserved function
When the inverter is in stop mode，this function can also be used to prevent wind milling．In addition，it can be used for the purpose of braking using the motor to consume the braking energy resulting in a better controlled stop．Refer to the DC brake parameter 07－16 for DC braking during start．

## Notes：

－The hold function at start is inactive when the hold frequency at start（11－43）is set to a value less than Fmin（01－08）．
－The hold function at stop is inactive when the hold frequency at stop（11－45）is set to a value less than Fmin（01－08）．

| $11-47$ | KEB Deceleration Time |
| :---: | :--- |
| Range | 【0．0～25．5】Sec |
| $11-48$ | KEB Detection Level |
| Range | 200V $: 【 190 \sim 210 】 \mathrm{~V}$ <br>  <br> 400V $: 【 380 \sim 420 】 \mathrm{~V}$ |

KEB function can be used to keep the inverter from tripping on a under voltage condition due to a momentary power－loss．To enable the KEB function set parameter $11-47$ to a value greater than 0.0 sec．

Upon detection of a power－loss the inverter uses the KEB deceleration time（11－47）to decelerate the motor and using the regenerative energy from the motor to maintain the DC－bus at a nominal level．

## 11－48：KEB detection level

If the DC－bus voltage falls below the value set in 11－48，the KEB is activated and the inverter starts decelerating according to the value set in 11－47．

To accelerate back to the original output frequency one of the digital inputs（03－00 to 03－05）set for 48 （KEB acceleration）has to be activated and the DC voltage has to rise above 11－48＋delta V （Delta $\mathrm{V}=$ +10 V for 200 V series，Delta $\mathrm{V}=+20 \mathrm{~V}$ for 400 V series）．

Refer to the example in Fig．4．4．83．

Figure 4．4．83 KEB operation

| $11-51$ | Braking Selection of Zero Speed |
| :---: | :--- |
| Range | 【0】：Disable |
|  | $【 1 】:$ Enable |

## 11－51：Operation selection of zero－speed braking

In V／F control mode，the DC braking operation can be used to the motor shaft．
Set 11－51 to select zero－speed braking operation to 1 to enable this function．

To use DC braking operation set parameter 00－02（operation command selection）to 1 and parameter 00－05（frequency reference selection）to 1，the operation command and frequency reference are now set for external control．When the frequency reference is 0 V （or less than 4 mA ），and the operation command is turned on，the zero－speed＇DC＇braking operation is activated and holding torque is generated using DC braking．

Refer to Fig．4．4．84 for more information on zero－speed DC braking operation．

Note：DC braking 07－07 is limited to $20 \%$ of the inverter rated current．

Figure 4．4．84 Zero－speed braking operation

| $11-54$ | Initialization of Cumulative Energy |
| :---: | :--- |
| Range | 【0】 ：Do not Clear Cumulative Energy |
|  | 【1】 ：Clear Cumulative Energy |

Reset the cumulative energy（KWHr）（12－67）and the cumulative energy（MWHr）（12－68）via parameter 11－54．

| $11-55$ | STOP Key Selection |
| :---: | :---: |
| Range | 【0】：Stop Key is Disabled when the Operation Command is not Provided by <br> Keypad． <br> 【1】：Stop Key is Enabled when the Operation Command is not Provided by <br> Keypad． |

11－55＝0：Stop button disabled when operation command is set for terminals（00－02＝1）or communication （00－02＝3）．
11－55＝1：Stop button enabled．

| $11-56$ | UP／DOWN Selection |
| :---: | :---: |
| Range | 【0】：When UP／DOWN in Keypad is Disabled，it will be Enabled if Pressing ENTER <br> after Frequency Modification． <br> 【1】 <br> When UP／DOWN in Keypad is Enabled，it will be Enabled upon Frequency <br> Modification． |

11－56＝0：Changing the reference frequency on the keypad in UP／DOWN control requires the ENTER button to be pressed for the inverter to accept the modified reference frequency．

11－56＝1：Changing the reference frequency on the keypad in UP／DOWN control immediately changes the reference frequency and there for the output frequency．

Note：The reference frequency can be changed（up or down）via the keypad or by setting one of multi－functional digital input terminals（03－00 to 03－05）to 8 and 9 ．Refer to instructions of （03－00 to 03－05＝ 8 or 9 ）．

| $11-58$ | Record Reference Frequency |
| :---: | :--- |
| Range | 【0】：Disable |
|  | 【1】：Enable |

This function is enabled only when one of multi－function digital input terminals（03－00 to 03－07）is set to 11 （ACC／DEC Inhibition command）．

11－58＝0：When ACC／DEC inhibition command is enabled，the motor will stop accelerating or decelerating and the frequency at the moment will be used as frequency command．If ACC／DEC inhibition command is disabled or stop command enabled，the frequency command will set to original frequency． Besides，when stop command enabled，or the power is cut off and reset．The frequency will be set to 0 Hz

Note：If ACC／DEC inhibition command is enabled before running，it will display STP0 after running，due to there is no reference frequency record．

11－58＝1：When ACC／DEC inhibition command is enabled，the output frequency will be recorded and to be used as frequency command．When it switches to stop or the power is cut off and reset，the ACC／DEC inhibition command is still enabled，the frequency command is still recorded and the frequency command is set to the frequency that was recorded．

Please refer to the following figure．

| $11-59$ | Gain of Preventing Oscillation |
| :--- | :--- |
| Range | $【 0.00 \sim 2.50 】$ |

Gradually increase the setting value with the unit of 0.01 when the motor is driven leading to the occurrence of oscillation under the state of normal duty．

| $11-60$ | Upper Limit of Preventing Oscillation |
| :--- | :--- |
| Range | 【0～100】\％ |

Function of prevention of oscillation upper limit is required to be within the setting value．

| $11-61$ | Time Parameter of Preventing Oscillation |
| :--- | :--- |
| Range | $【 0 \sim 100 】$ |

Adjust the response of oscillation function．That is，adjust once delay time parameter of prevention oscillation function．

| $11-62$ | Prevention of Oscillation Selection |
| :--- | :--- |
| Range | 【0】：Mode 1 |
|  | 【1】：Mode 2 |
|  | 【2】：Mode 3 |

When $11-62$ is set to 0 and 1 ，the response to prevention oscillation is slower．
When 11－62 is set to 2 ，the response to prevention oscillation is faster．

| $11-63$ | Flux－Strengthening Selection |
| :---: | :--- |
| Range | 【0】：Disable |
|  | 【1】：Enable |

11－63＝0：It has no function of flux－strengthening，the no－load current of high speed and low speed are the same．
11－63＝1：It has function of flux－strengthening，the torque of low speed is higher，but the no－load current is also higher，it is suitable for big load in low speed．

| 11－69 | Gain of Preventing Oscillation 3 |
| :--- | :--- |
| Range | $0.00 \sim 200.00 \%$ |

Adjust the response of Gain of Preventing Oscillation 3
If vibration with motor in ND mode occurs，please increase by 0.01 unit to set．

| 11－70 | Upper Limit of Preventing Oscillation 3 |
| :--- | :--- |
| Range | $0.01 \sim 100.00 \%$ |

It is required to limit the preventing oscillation 3 upper limit within the setting value．

| 11－71 | Time Parameter of Preventing Oscillation 3 |
| :---: | :--- |
| Range | $0 \sim 30000 \mathrm{~ms}$ |

Adjust the response of oscillation 3 function．（Time parameter of adjust preventing oscillation function delay．）

| 11－72 | Switch Frequency 1 for Preventing Oscillation Gain |
| :--- | :--- |
| Range | $0.01 \sim 300.00 \mathrm{~Hz}$ |
| $11-73$ | Switch Frequency 2 for Preventing Oscillation Gain |
| Range | $\mathbf{0 . 0 1 \sim 3 0 0 . 0 0 ~ H z}$ |

Refer to the following figure for the setting of parameters 11－72 and 11－73．

## Group 12：Monitoring Parameters

| 12－00 | Display Screen Selection（LED） |  |
| :---: | :---: | :---: |
| Range | Highest bit＝＞$\underline{0} \underline{0} \underline{0} \underline{\underline{0}} \underline{0}$＜＝lowest bit <br> The value range of each bit is $0 \sim 7$ from the highest bit to the lowest bit， |  |
|  | 【0】 ：No display <br> 【2】 ：Output Voltage <br> 【4】 ：heatsink Temperature <br> 【6】：Al1 Value | 【1】 ：Output Current <br> 【3】 ：DC Bus Voltage <br> 【5】 ：PID Feedback <br> 【7】 ：Al2 Value |

Note：The highest bit is used for power－up monitor．The 4 least significant bits can be used to customize the display sequence see section 4．1．3．

| $12-01$ | PID Feedback Display Mode（LED） |
| :---: | :--- |
| Range | 【0】：Display the Feedback Value by Integer（xxx） |
|  | 【1】：Display the Feedback Value by the Value with First Decimal Place（xx．x） |
|  | 【2】：Display the Feedback Value by the Value with Second Decimal Places（x．xx） |
| $12-02$ | PID Feedback Display Unit Setting（LED） |
| Range | 【0】：xxxxx（no unit） |
|  | 【1】：xxxPb（pressure） |
|  | 【2】：xxxFL（flow） |

When 12－00＝xxx5，PID Feedback is displayed in LED keypad．Parameter 12－01 will take the value of parameter 10－33 to convert to be five digits display XXX．XX．

For example，when parameter 10－33＝9999，
$12-01=0$ ，the default display is 99 ；
$12-01=1$ ，the default display is 99.9 ；
$12-01=2$ ，the default display is 99.99 ；
if with the setting value of parameter 12－02，when 12－01＝1 and 12－02＝1，it displays 99．9Pb five digits；when $12-01=2$ and $12-02=2$ ，it displays 9.99 FL and tenth digit 9 will be concealed．

| $12-03$ | Line Speed Display（LED） |
| :---: | :--- |
| Range | 【0～60000】RPM |
| $12-04$ | Line Speed Display Mode（LED） |
|  | $【 0 】:$ Display Inverter Output Frequency |
|  | 【1】：Line Speed Display at Integer．（xxxxx） |
| Range | 【2】：Line Speed Display at One Decimal Place．（xxxx．x） |
|  | 【3】：Line Speed Display at Two Decimal Places．（xxx．xx） |
|  | 【4】：Line Speed Display at Three Decimal Places．（xx．xxx） |

## $12-04=0$

Inverter displays the line speed at stop，operation or the modification of frequency．

## 12－04＝0

12－03 is set to the maximum line speed and corresponds to the maximum output frequency．

For example，if the line speed display of $12-03$ is 1800 ，the keypad display is 900 when frequency output is 30 Hz ．

| $12-05$ | Status Display of Digital Input Terminal（LED／LCD） |
| :---: | :--- |
| Range | Read－only |

Terminals $\mathrm{S} 1-\mathrm{S} 6$ are represented using two segments of each digit．Segment turns on when input is active． The bottom segments of each of the first three digits are used to represent the digital outputs（R1，R2，R3）． Segments turn on when output is active．

When operation command is changed to PLC，press RUN key and it will light up．

Example1：S1～S6，R1，R2 and R3 are ON

Example2：S1～S6，R1，R2 and R3 are OFF

| $12-81$ | Relay Card Display (LED/LCD) |
| :---: | :--- |
| Range | Readable only (only for keypad) |

Please refer to parameter group 24.
$10-03=x x x 1 b$
1 to 8 Relay card is installed.
24-00=1
$24-07=0$ : Relay is ON and RUN.
Display sequency:
LED display (without output):
LCD display:

LED display (when input and output is active):

$10-03=x x x 1 b$

Control board Relay is installed.
$24-00=1$

24-07=1: Relay is ON and RUN.
Display sequence:
LED display (without output):
LCD display:

LED display (when input and output is active):

Note: Refer to section 4.3 for other monitor parameters 12-11~12-82.

Monitor parameters 12-67 (KWHr) and 12-68 (MWHr) is the display of accumulative energy.

Note: Parameter 11-54 can clear the monitor parameter.

Monitor parameter 12-76 (No-load voltage) is required to refer to the descriptons of parameter 02-09(Motor 1 excitation current) and 17-09 (Motor excitation current).

| $13-00$ | Inverter Rating Selection |
| :---: | :--- |
| Range | $\mathbf{0 0 H} \sim \mathrm{FFH}$ |

| Inverter model | 13－ 00 display |
| :---: | :---: |
| F510－2001－XXX | 201 |

| F510－4535－XXX | 4535 |
| F510－4670－XXX | 4670 |
| F510－4800－XXX | 4800 |

| $13-01$ | Software Version |
| :--- | :--- |
| Range | $0.00-9.99$ |
| $13-02$ | Clear Cumulative Operation Hours Function |
| Range | 【0】：Disable to Clear Cumulative Operation Hours <br> 【1】：Clear Cumulative Operation Hours |
| $13-03$ | Cumulative Operation Hours 1 |
| Range | 【0～23】hours |
| $13-04$ | Cumulative Operation Hours 2 |
| Range | 【0～65534】days |
| $13-05$ | Selection of Accumulative Operation Time |
| Range | 【0】：Accumulative time in power on <br> 【1】：Accumulative time in operation |

When 13－02 set to 1 ，the value of $13-03 / 13-04$ will be cleared．

13－05＝0：Inverter logs the time while the inverter is powered－up．
13－05＝1：Inverter logs the time when the inverter is running．

| $13-06$ | Parameters Locked |
| :---: | :--- |
| Range | 【0】 ：Only parameter 13－06 and frequency command parameters in main screen <br> are writable |
|  | 【1】：Only user parameter is enabled． |
|  |  |

When 13－06＝0，only parameter 13－06 and frequency command parameter in main screen can be set but other parameters are read－only．

When $13-06=1$ ，only user parameters（00－41～00－56）are enabled．Please refer to the instruction of parameters 00－41～00－56．

Note：it is only enabled in LCD keypad．

When $13-06=2$ ，all parameters are writable except for the read－only parameters．

## Note：

Main frequency setting is 12－16．The value is equal to frequency setting of speed－stage 0 （05－01）in LCD keypad．
LED Main Frequency can be set in the main frequency display

| $13-07$ | Parameter Password Function |
| :--- | :--- |
| Range | $【 00000 \sim 65534 】$ |

When the setting value of parameter $13-07$ is enabled（13－07 $>0$ ），all the parameters can not be adjusted except the frequency in main screen so user needs to input the password to adjust it．

Password setting：

First step：

Second step:

Password Input :

| 13－08 | Restore Factory Setting |
| :---: | :---: |
| Range | 【0】：No Initialization |
|  | 【1】 ：Reserved |
|  | 【2】： 2 Wire Initialization（ $220 / 440 \mathrm{~V}, 60 \mathrm{~Hz}$ ） |
|  | 【3】 ： 3 Wire Initialization（220／440V，60Hz） |
|  | 【4】 ： 2 Wire Initialization（ $230 / 415 \mathrm{~V}, 50 \mathrm{~Hz}$ ） |
|  | 【5】 ： 3 Wire Initialization（230／415V，50Hz） |
|  | 【6】 ： 2 Wire Initialization（200／380V， 50 Hz ） |
|  | 【7】 ： 3 Wire Initialization（200／380V，50Hz） |
|  | 【8】 ：PLC Initialization |
|  | 【9】 ： 2 Wire Initialization（ $230 \mathrm{~V} / 460 \mathrm{~V}, 60 \mathrm{~Hz}$ ） |
|  | 【10】 ： 3 Wire Initialization（230V／460V，60Hz） |
|  | 【11】 ： 2 wire Initialization（ $230 \mathrm{~V} / 400 \mathrm{~V}, 60 \mathrm{~Hz}$ ） |
|  | 【12】 ： 3 wire Initialization（230V／400V， 60 Hz ） |
|  | 【13】 ： 2 wire Initialization（230V／400V， 50 Hz ） |
|  | 【14】： 3 wire Initialization（230V／400V， 50 Hz ） |
|  | 【15】 ： 2 wire Initialization（220V／380V， 50 Hz ） |
|  | 【16】 ： 3 wire Initialization（220V／380V，50Hz） |
|  | 【Others】：Reserved |

Note：Main frequency setting is 12－16．The value is equal to frequency setting of speed－stage 0 （05－01）
Use parameter 13－08 to initialize the inverter to factory default．It is recommended to write down the modified parameters before initializing the inverter．After initialization，the value of 13－08 will return to zero automatically．

13－08＝2：2－wire initialization（220V／440V）
Multi－function digital input terminal S1 controls forward operation／stop command，and S2 controls reverse operation／stop command．Refer to Fig．4．4．1．

Inverter input voltage（01－14）is automatically set to 220 V （ 200 V class）or 440 V （ 400 V class）．

When 01－00（V／F curve）set to F，Inverter maximum frequency（01－12）is automatically set to 60 Hz ．
13－08＝3：3－wire initialization（220V／440V）
Multi－function digital input terminal S5 controls the forward／reverse direction，and terminals S1 and S2 are set for 3－wire start operation and stop command．Refer to Figure 4．4．2 and Figure 4．4．3 for 3－wire type operation mode．

Inverter input voltage（01－14）is automatically set to 220 V （ 200 V class）or 440 V （ 400 V class）．

When 01－00（V／F curve）set to F，Inverter maximum frequency（01－12）is automatically set to 60 Hz ．
13－08＝4：2－wire initialization（230V／415V）

Multi－function digital input terminal S1 controls forward operation／stop command，and S2 controls reverse operation／stop command．Refer to Fig．4．4．1．

Inverter input voltage（01－14）is automatically set to 230 V （ 200 V class）or 415 V （ 400 V class）．

When 01－00（V／F curve）set to F，Inverter maximum frequency（01－12）is automatically set to 50 Hz ．
13－08＝5：3－wire initialization（230V／415V）

Multi-function digital input terminal S5 controls the forward / reverse direction, and terminals S1 and S2 are set for 3-wire start operation and stop command.

Inverter input voltage (01-14) is automatically set to 230 V ( 200 V class) or 415 V ( 400 V class).

When 01-00 (V/F curve) set to F, Inverter maximum frequency (01-12) is automatically set to 50 Hz .
13-08=6: 2-wire initialization (200V/380V)

Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Fig.4.4.1.

Inverter input voltage (01-14) is automatically set to 200 V ( 200 V class) or 380 V ( 400 V class).

When 01-00 (V/F curve) set to F, Inverter maximum frequency (01-12) is automatically set to 50 Hz .

## 13-08=7: 3-wire initialization (200V/380V)

Multi-function digital input terminal S5 controls the forward / reverse direction, and terminals S1 and S2 are set for 3-wire start operation and stop command.

Inverter input voltage (01-14) is automatically set to 200 V ( 200 V class) or 380 V ( 400 V class).

When 01-00 (V/F curve) set to F, Inverter maximum frequency (01-12) is automatically set to 50 Hz .
13-08=8: PLC initialization
Clear built-in PLC ladder logic and related values.
13-08=9: 2 wire initialization ( $230 \mathrm{~V} / 460 \mathrm{~V}, 60 \mathrm{~Hz}$ )
Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Figure 4.4.1. The input voltage ( $01-14$ ) will be set to 230 V ( 200 V class) or 460 V ( 400 V class) automatically and when 01-00 (V/F curve) is set to $F$, the maximum frequency of $01-12$ will be set to 60 Hz automatically.

13-08=10: 3 wire initialization ( $230 \mathrm{~V} / 460 \mathrm{~V}, 60 \mathrm{~Hz}$ )
Multi-function digital input terminal S7 controls the forward / reverse direction, and terminals S1 and S2 are set for 3-wire start operation and stop command. Refer to Figure 4.4.2 and Figure 4.4.3 for 3-wire type operation mode. The input voltage (01-14) will be set to 230 V ( 200 V class) or 460 V ( 400 V class) automatically and when $01-00$ (V/F curve) is set to $F$, the maximum frequency of $01-12$ will be set to 60 Hz automatically.

13-08=11: 2 wire initialization $(230 \mathrm{~V} / 400 \mathrm{~V}, 60 \mathrm{~Hz})$
Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Figure 4.4.1. The input voltage ( $01-14$ ) will be set to 230 V ( 200 V class) or 400 V ( 400 V class) automatically and when $01-00$ (V/F curve) is set to $F$, the maximum frequency of $01-12$ will be set to 60 Hz automatically.

13-08=12: 3 wire initialization $(230 \mathrm{~V} / 460 \mathrm{~V}, 60 \mathrm{~Hz})$
Multi-function digital input terminal S7 controls the forward / reverse direction, and terminals S1 and S2 are set for 3 -wire start operation and stop command. Refer to Figure 4.4.2 and Figure 4.4 .3 for 3-wire type operation mode. The input voltage ( $01-14$ ) will be set to 230 V ( 200 V class) or 400 V ( 400 V class) automatically and when $01-00$ (V/F curve) is set to $F$, the maximum frequency of $01-12$ will be set to 60 Hz automatically.

13-08=13: 2 wire initialization (230V/400V, 50 Hz )

Multi－function digital input terminal S1 controls forward operation／stop command，and S2 controls reverse operation／stop command．Refer to Figure 4．4．1．The input voltage（ $01-14$ ）will be set to 230 V （ 200 V class） or 400 V （ 400 V class）automatically and when 01－00（V／F curve）is set to $F$ ，the maximum frequency of $01-12$ will be set to 50 Hz automatically．

13－08＝14： 3 wire initialization $(230 \mathrm{~V} / 460 \mathrm{~V}, 50 \mathrm{~Hz})$
Multi－function digital input terminal S7 controls the forward／reverse direction，and terminals S1 and S2 are set for 3－wire start operation and stop command．Refer to Figure 4．4．2 and Figure 4．4．3 for 3－wire type operation mode．The input voltage（ $01-14$ ）will be set to 230 V （ 200 V class）or 400 V （ 400 V class） automatically and when 01－00（V／F curve）is set to F ，the maximum frequency of $01-12$ will be set to 50 Hz automatically．

13－08＝15： 2 wire initialization（ $220 \mathrm{~V} / 380 \mathrm{~V}, 50 \mathrm{~Hz}$ ）
Multi－function digital input terminal S1 controls forward operation／stop command，and S2 controls reverse operation／stop command．Refer to Fig．4．4．1．The input voltage（01－14）will be set to 220 V （ 200 V class）or 380 V （400V class）automatically and when 01－00（V／F curve）is set to $F$ ，the maximum frequency of 01－12 will be set to 50 Hz automatically．

13－08＝16： 3 wire initialization（ $220 \mathrm{~V} / 380 \mathrm{~V}, 50 \mathrm{~Hz}$ ）
Multi－function digital input terminal S7 controls the forward／reverse direction，and terminals S1 and S2 are set for 3－wire start operation and stop command．Refer to Figure 4．4．2 and Figure 4．4．3 for 3－wire type operation mode．The input voltage（01－14）will be set to 220 V （ 200 V class）or 380 V （ 400 V class） automatically and when $01-00$（V／F curve）is set to $F$ ，the maximum frequency of $01-12$ will be set to 50 Hz automatically．

Note：Restore factory setting（13－08）will not modify the setting of 01－00（V／F curve）．

Parameter List：parameters that are not affected by default value

| No． | Parameter Name |
| :---: | :--- |
| $00-00$ | Control Mode Selection |
| $00-04$ | Language Selection |
| $01-00$ | V／F Curve Selection |
| $13-00$ | Inverter Rating Selection |
| $13-03$ | Cumulative Operation Hours 1 |
| $13-04$ | Cumulative Operation Hours 2 |
| $13-05$ | Selection of Accumulative Operation Time |

| $13-09$ | Fault History Clearance Function |
| :---: | :--- |
| Range | 【0】：Do not Clear Fault History |
|  | 【1】：Clear Fault History |

13－09＝1：Clear inverter fault history including（12－11～12－15／12－45～12－64）

| $13-10$ | Parameter Password Function 2 |
| :--- | :--- |
| Range | $0 \sim 9999$ |

| $13-11$ | C／B CPLD Ver． | ＊1 |
| :---: | :---: | :---: |
| Range | $【 0.00 \sim 9.99 】$ |  |

This parameter displays CPLD version on the control board．

| $13-12$ | Option Card Id |
| :--- | :--- |

This parameter displays option card Id on the control board and it is enabled only with the option card．

```
【0】：None
【8】 ：10－8DO
```

| $13-13$ | Option Card CPLD Ver． |
| :--- | :--- |

＊1：It is new added in inverter software V1．4．

This parameter displays option card CPLD version on the control board and it is enabled only with option card．

| 13－14 | Fault Storage Selection |
| :---: | :--- |
| Range | 【0】 ：Auto Restart Fault Messages are not saved in fault history during Auto－Restart． |
|  | 【1】 ：Auto Restart Fault Messages are saved in fault history during Auto－Restart． |

## 13－14＝0，

Fault messages are not saved in fault history（12－46～12－49 \＆13－21～13－50）during the process when auto restart function is active．

13－14＝1，
Fault messages are saved in fault history（12－46～12－49 \＆13－21～13－50）during the process when auto restart function is active．

Note：Parameters 13－21～13－50 are 30 Fault History：When it detect fault，inverter will store to fault history． If the fault occurs again，parameter 13－21 will change to parameter 13－22．

## Group 14：PLC Setting Parameters

## Group 16：LCD Function Parameters

| $16-00$ | Main Screen Monitoring |
| :---: | :--- |
| Range | $【 5 \sim 82 】$ |
| $16-01$ | Sub－Screen Monitoring 1 |
| Range | $【 5 \sim 82 】$ |
| $16-02$ | Sub－Screen Monitoring 2 |
| Range | $【 5 \sim 82 】$ |

At power－up the inverter shows two monitor section on the display，main monitor section and the sub－screen monitor section（smaller font）．
Choose the monitor signal to be displayed as the main－screen monitor screen in parameter 16－00，and the monitor signals to be displayed on the sub－screen monitor in parameters 16－01 and 16－02，similar to monitor parameters 12－5～12－82．

Note：The setting value of 16－00，16－01 and 16－02 can be modified．It also can reset except PID modes （refer to the setting description of parameter 10－03）and PUMP modes（refer to the setting description of parameter 23－00），but these two modes can be modified in inverter software V1．4．

| 16－03 | Selection of Display Unit |
| :---: | :---: |
| Range | 【0】 ：Display unit is Hz （Resolution is 0.01 Hz ） <br> 【1】 ：Display unit is \％（Resolution is $0.01 \%$ ） <br> 【2】 ：Rpm display；motor rotation speed is set by the control modes to select IM （02－07）／PM（22－03）motor poles to calculate． <br> 【3～39】：Reserved <br> 【40～9999】：100\％is XXXX with no decimals（integer only） <br> 【10001～19999】：100\％is XXX． X with 1 decimal <br> 【20001～29999】：100\％is XX．XX with 2 decimals <br> 【30001～39999】：100\％is X．XXX with 3 decimals |
| 16－04 | Selection of Engineering Unit |

|  | 【23】：Pa |
| :--- | :--- |
|  | 【24】：KPa |

＊1：It is new added in inverter software V1．4．

16－03：Display unit of digital operator

Set the units of the following items to be displayed，the frequency reference（05－01，00－18，06－01～06－15） and the monitoring frequency 12－16，12－17（Output frequency）

16－04：Display unit of engineering

When 16－03＝00040－39999，engineering units are enabled．The displayed set range and the frequency range of unit（05－01，06－01～06－15）as well as the monitoring frequency（12－16，12－17）are changed by parameters 16－04 and 16－03．

| 16－03 | Set／displayed contents |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0.01 Hz |  |  |  |
| 1 | 0.01 \％（maximum output frequency 01－02＝100\％） |  |  |  |
| 2 | RPM（RPM＝ $120 \times$ reference frequency／numbers of motor pole．The numbers of motor pole is set by 02－07 in the control modes of V／F or SLV and is set by 22－03 in PMSLV．） |  |  |  |
| 3－39 | Reserved |  |  |  |
| $\begin{gathered} 00040 \\ - \\ 39999 \end{gathered}$ | Set the decimal point by using the fifth place． |  |  |  |
|  | 16－03 | Display | Display unit | Display example |
|  | $\begin{gathered} 00040 \\ -\quad \\ 09999 \end{gathered}$ | 믐 | use 16－04 setting | Example： 100 \％speed is 0200 <br> ＞set 16－03＝00200（from 05－01，06－01 to 06－15，set range from 0040 to 9999）． <br> ＞set 16－04＝0（no unit） |
|  | $\begin{gathered} 10001 \\ -\quad \\ 19999 \end{gathered}$ | 므．$\square$ |  | Example： 100 \％speed is 200．0 CFM <br> ＞set 16－03＝12000（05－01，06－01 to 06－15，set range from 0000 to 9999）． <br> ＞set 16－04＝2（CFM） <br> $>60 \%$ speed will be displayed as 120．0 CFM |
|  | $\begin{gathered} 20001 \\ -\quad \\ 29999 \end{gathered}$ | ㅁ․ 미 |  | ```Example: \(100 \%\) speed is \(65.00^{\circ} \mathrm{C}\) > set \(16-03=26500\) ( \(05-01,06-01\) to \(06-15\), set range from 0000 to 9999 ) \(>\) set \(16-04=20\left({ }^{\circ} \mathrm{C}\right)\) \(>60 \%\) of speed is displayed as \(39.00^{\circ} \mathrm{C}\)``` |
|  | 30001 - 39999 | ㅁ．믐 |  | Example： $100 \%$ speed is $2.555 \mathrm{~m} / \mathrm{s}$ <br> $>$ set 16－03＝32555 <br> ＞set 16－04＝14（ $\mathrm{m} / \mathrm{s}$ ） <br> $>60 \%$ speed is displayed as $1.533 \mathrm{~m} / \mathrm{s}$ |

| $16-05$ | LCD Backlight |
| :--- | :--- |
| Range | $\lfloor 0 \sim 7 】$ |

Adjust the screen contrast of the digital operator．If it is set to 0 ，the screen backlight is turned off．

| $16-07$ | Copy Function Selection |
| :---: | :--- |
| Range | 【0】：Do not copy parameters |
|  | 【1】 ：Read inverter parameters and save to the operator． |
|  | 【2】 Write the operator parameters to inverter． |
| $16-08$ | Selection of Allowing Reading |
| Range | 【0】 $:$ Do not allow to read inverter parameters and save to the operator． |

LCD digital operator with built－in memory（EEPROM）can be used to store and retrieve parameters：
（1）Read：Save inverter parameters to the digital operator（INV $\rightarrow$ OP）．
（2）Write：Write the parameters from the digital operator to the inverter and save（OP $\rightarrow$ INV）．
（3）Verify：Compare the inverter parameters against the parameters in the digital operator．
16－07＝0：No action
16－07＝1：Read（all parameters are copied from the inverter to the keypad）．
16－07＝2：Write（all parameter are copied from the keypad to the inverter）．
16－07＝3：Verify（Compare the set value of the inverter to the parameter of the digital operator）．
Set 16－08＝0，to prevent the saved parameter data stored in the digital operator from accidentally being overwritten．

When parameter $16-08=0$ and the read operation is executed（16－07＝1）a warning message of＂RDP Read Prohibited＂will be displayed on the keypad and the read operation is cancelled．

Refer to the following steps for copy function operation．
For the write－in operation requires the following items to match．
（1）Software version
（2）Control method
（3）Inverter type
（4）Inverter rated capacity and voltage

Set one of the parameters 03－00 to 03－05（multi－function digital input selection）to 49 （Enable the parameter write－in function）to enable or disable the parameter write－in function．

When terminal is active，parameters can be copied from the digital operator to the inverter．When the terminal is not active inverter parameters are prohibited from write－in，excluding the reference frequency （00－05）．

Note：Parameter 16－11（RTC date setting）and 16－12（RTC time setting）require resetting，after parameter setting in the keypad is written and saved in the inverter（ $\mathrm{OP} \rightarrow \mathrm{INV}$ ）．

■ READ : Copy inverter parameters to the keypad

| Steps | LCD Display (English) | Description |
| :---: | :---: | :---: |
| 1 | Group <br> 14 PLC Setting <br> 15 PLC Monitor <br> 16 LCD Keypad Func. | Select the copy function group (16) from the group menu. |
| 2 | PARA <br> $-07:$ Copy Sel <br> $-08:$ READ Sel <br> $-09:$ Keypad Loss Sel | Press the Read / Enter key and select parameter (16-07) copy sel. |
| 3 |  | Press the Read / Enter key to display the data setting / read screen (LCD display is inversed). |
| 4 |  | Change the set value to 1 (read) by using the up arrow key. |
| 5 | $\square$ | - Use Read / Enter key to enable the read operation, the display is shown as the left. <br> - The bottom of LCD display will show a bar to indicate the read progress s. |
|  | -ADV- <br> READ COMPLETE | "READ COMPLETE" will be displayed on the keypad when reading was successful. |
| 6 | $\begin{aligned} & \text { Read } \quad \text { Prohibited } \\ & \hline \end{aligned}$ | - The error message of "RDP Read Prohibited" may occur on the keypad when reading parameters from the inverter is prohibited. <br> - If the error is displayed, press any key to remove the error message and go back to parameter 16-07. |
| 7 |  | When DSP/FUN key is pressed, the display returns to parameter 16-07. |

- WRITE: Copy Keypad parameters to the Inverter

| Steps | LCD Display (English) | Description |
| :---: | :---: | :---: |
| 1 | Group <br> 14 PLC Setting <br> 15 PLC Monitor <br> 16 LCD Keypad Func. | Select the copy function group (16) from the group menu. |
| 2 | PARA <br> $-07:$ Copy Sel 16 <br> $-08:$ READ Sel <br> -09: Keypad Loss Sel | Press the Read / Enter key and select parameter (16-07) copy sel. |
| 3 |  | Press the Read / Enter key to display the data setting / read screen (LCD display is inversed). |
| 4 |  | Change the set value to 2 (write) by using the up arrow key. |

| Steps | LCD Display (English) | Description |
| :---: | :---: | :---: |
| 5 | -ADV- WRITE INV $\rightarrow$ OP | - Use Read / Enter key to enable the read operation, the display is shown as the left. <br> - The bottom of LCD display will show a bar to indicate the read progress. |
| 6 | -ADV- <br> WRITE COMPLETE | "WRITE COMPLETE" will be displayed on the keypad when writing was successful. <br> - Until the subsequent display of "SysInit", please power off and restart. |
|  | WRE <br> Write Error | - The error message of "WRE Write Error " may occur on the keypad when writing parameters to the inverter is prohibited. <br> - If the error is displayed, press any key to remove the error message and go back to parameter 16-07. |
| 7 | Edit Copy Sel 16-07 | When DSP/FUN key is pressed, the display returns to parameter 16-07. |
|  | $\begin{aligned} & \underline{\mathbf{Z}} \text { WRITE } \\ & (0-3) \\ & \langle 0\rangle \end{aligned}$ |  |

- Verify: Compare Inverter Parameters against Keypad Parameters.

| Steps | LCD Display (English) | Description |
| :---: | :---: | :---: |
| 1 | Group <br> 14 PLC Setting <br> 15 PLC Monitor <br> 16 LCD Keypad Func. | Select the copy function group (16) from the group menu. |
| 2 | PARA <br> $-07:$ Copy Sel <br> $-08:$ READ Sel <br> $-09:$ Keypad Loss Sel | Press the Read / Enter key and select parameter (16-07) copy sel. |
| 3 |  | Press the Read / Enter key to display the data setting / read screen (LCD display is inversed). |
| 4 |  | Change the set value to 3 (verify) by using the up arrow key. |
| 5 | -ADV- <br> VERIFY <br> INV $\rightarrow$ OP  <br>   | - Use Read / Enter key to enable the read operation, the display is shown as the left. <br> - The bottom of LCD display will show a bar to indicate the read progress. |
|  | -ADV- <br> VERIFY COMPLETE | "VERIFY COMPLETE" will be displayed on the keypad when writing was successful. |
| 6 | VERY <br> Verify Error | - The error message of "VRYE Verify Error " may occur on the keypad when writing parameters to the inverter is prohibited. <br> - If the error is displayed, press any key to remove the error message and go back to parameter 16-07. |
| 7 |  | When DSP/FUN key is pressed, the display returns to parameter 16-07. |

| $16-09$ | Selection of Operator Removed（LCD） |
| :---: | :--- |
| Range | 【0】：Keep operating when LCD operator is removed． |
|  | 【1】：Display fault to stop when LCD operator is removed |

16－09＝0：Continue operating when keypad is removed．

16－09＝1：Trip inverter when keypad is removed while operating in local mode．

| $16-10$ | RTC Time Display Setting |
| :---: | :--- |
| Range | 【0】：Hide <br> 【1】：Display |
| $16-11$ | RTC Date Setting |
| Range | 【12．01．01～99．12．31】 |
| $16-12$ | RTC Time Setting |
| Range | 【00：00 $\sim 23: 59 】$ |

Set the internal clock before using the function of Real Time Clock（RTC）．
RTC date setting is determined by parameter 16－11 and RTC time setting is determined by parameter 16－12．

RTC is displayed in the top of the keypad and refer to Fig．4．4．85 for the selection of RTC time display （16－10）is set to 1.

| Monitor$00: 00$ <br> Freq Ref <br> $12-16=$ |
| :---: | :---: |
| $12-17=000.00 \mathrm{~Hz}$ |
| $12-18=000.00 \mathrm{~Hz}$ |

Figure 4．4．85 RTC Time Display（Example）

## Notes：

－RTC is not enabled if keypad does not connect with the inverter．
－The counting time continues running regardless of the function being hide or display in the paramerer 16－10（RTC Time Display Setting）．

Users can apply the parameters 12－72 and 12－73 to monitor the specific RTC date and time．
RTC has the following characteristics：
－Four times a day
－Four weeks
－Timer offset function（preset time）
－Timrer enables via multi－function digital input
－Selection for contant time and speed
－Timer enables multi－function digital output

|  | $【 0 x x x B 】: R T C$ Run4 Forward Rotation 【1xxx B】：RTC Run4 Reverse Rotation |

Source of timer can be selected to link multiple time periods and one time period can be set to multiple timers．

Timer is set by the following steps：

## （1）Start the timer：

Timer starts via the setting of RTC timer function（16－13）．
（2）Set the time period：
Set the start \＆stop time and date．If the setting of start time is equal to that of stop time，timing period is off．
（3）The timer is enabled：
Arrange time period to the specific timer（16－32～16－35）．

## （4）Link to parameters：

The timer can be linked to the relay output．One relay output can be only linked to one timer（ ex．03－11， 03－12 and 03－39，16－36）．

Note：If the stop time is set to 12：00，Motor start to stop from 12：01．
Refer to Fig．4．4．86 for RTC structure．

Figure 4．4．86 RTC structure
Refer to the following Table 4．4．13 for the selection of timer operation cycle．

Table 4．4．13 Arrange time period to the timer function

Reference frequency and motor rotation direction are controlled by RTC function.
$16-36=0$ : RTC speed selection is disabled.
16-36=1: Timer 1 is enabled.

Reference frequency $=$ Frequency Setting of Speed-Stage 0 (05-01)
16-36=2: Timer 2 is enabled.
Reference frequency $=$ Frequency Setting of Speed-Stage 0 (05-01)
$16-36=3$ : Timer 3 is enabled.
Reference frequency $=$ Frequency Setting of Speed-Stage 0 (05-01)
16-36=4: Timer 4 is enabled.
Reference frequency = Frequency Setting of Speed-Stage 0 (05-01)
$16-36=5$ : Timer 1 and 2 are enabled.
Reference frequency is enabled by the simultaneous operation of timer 1 and 2.

## Notes:

- The inverter runs via the start of the specific timer without the influence of other timers.
- The selection of RTC speed setting (16-36) is affected by the action of time period 1 to 4 (P1~P4) which is corresponding to the selection of RTC rotation direction (16-37). For example:
When the selection of RTC speed is set to 5 (by timer $1+2$ ), source of run command (00-02) and source of frequecny command (00-05) are required to set to RTC. Thus, reference frequency is controlled by RTC timer 1 and 2 and the inverter continues running.

Refer to Table 4.4.14 for the control of reference frequency.
Note: Selection of RTC Rotation Direction (16-37) is limited by the Motor Direction Lock Selection(11-00).
Note: The offset 16-37 running direction will select by the direction of the timer 1.

Table 4.4.14 Reference frequency is determined by timer 1 and 2

| Timer 1 | Timer 2 | Main Frequency Command <br> Source Selection (00-05) | Source of frequency setting | Selection of rotation <br> direction |
| :---: | :---: | :---: | :--- | :---: |
| 0 | 0 | $6($ RTC $)$ | Set by frequency setting of <br> speed-stage 0 (05-01) | By RTC 1 (16-37) |
| 1 | 0 | $6($ RTC $)$ | Set by frequency setting of <br> speed-stage 1 (05-02) | By RTC 2 (16-37) |
| 0 | 1 | $6($ RTC) | Set by frequency setting of <br> speed-stage 2 (05-03) | By RTC 3 (16-37) |
| 1 | 1 | 6(RTC) | Set by frequency setting of <br> speed-stage 3 (05-04) | By RTC 4 (16-37) |

RTC function can not run normally when:

- When multi-function terminal (03-00~03-05) is set to the fire mode.
- When KEB function is enabled
- Source of main frequency of RTC function is according to Table 4.4.14 and also can refer to main and alternative frequency command modes (00-07).
- If main run command source selection (00-02) is set to 0~3 (0: keypad, 1: external terminal, 2: communication control, 3: PLC), refer to Table 4.4.15 for the relationship between main run command and RTC timer status.

Table 4.4.15 Relationship between main run command and RTC timer status

| Main run command <br> $\mathbf{0 0 - 0 2}$ | RTC timer $\mathbf{x}$ status | Inverter status |
| :---: | :---: | :--- |
| $0 \sim 3$ | 0 | Inverter can not run (without run command) |
| $0 \sim 3$ | 1 | Inverter can not run (without run command) |
| 4 | 0 | Inverter can not run (RTC timer is disabled) |
| 4 | 1 | Inverter runs and rotates depending on the function <br> of 16-37. |

Take an example for RTC timer connecting with different parameters:

The work time on Monday is 6:00 AM to 10:00 PM.
The work time on Tuesday to Friday is 8:00 AM to 8:00 PM.
The work time on Saturday is 8:00 AM to 6:00 PM.
The work time on Sunday is 8:00 AM to 12:00 PM.
Motor runs on weekdays (Mon. to Fri.) at speed 1 and on weekends at speed 2.

Figure 4.4.87 RTC timer (example)
(1) Start up the timer in the parameter group 16 (Set the internal time first to enable this function).

Set the correct date and time in the parameters 16-11 and 16-12 and set parameter 16-13 to 1(enable RTC timer function).
(2) Set time period 1 (P1)

Start time 1: 16-14 = 06:00:00 (6:00 AM)
Stop time 1: 16-15 = 22:00:00 (10:00 PM)
Start date 1: 16-16 = 1 (Monday)
Stop date 1: 16-17 = 1 (Monday)
(3) Set time period 2 (P2)

Start time 2: 16-18 = 08:00:00 (8:00 AM)
Stop time 2: 16-19 = 20:00:00 (8:00 PM)
Start date 2: 16-20 $=2$ (Tuesday)
Stop date 2: 16-21 = 5 (Friday)
(4) Set time period 3 (P3)

Start time 3: 16-22 = 08:00:00 (8:00 AM)
Stop time 3: 16-23 = 18:00:00 (6:00 PM)
Start date 3: 16-24 = 6 (Saturday)
Stop date 3: 16-25 = 6 (Saturday)

## Set time period 4 (P4)

Start time 4: 16-26 = 08:00:00 (8:00 AM)
Stop time 4: 16-27 = 12:00:00 (12:00 AM)
Start date 4: 16-28 = 7 (Sunday)
Stop date 4: 16-29 = 7 (Sunday)
(6) Timer 1 is enabled to set all the time periods ( $\mathrm{P} 1, \mathrm{P} 2, \mathrm{P} 3, \mathrm{P} 4$ )

16-32 = 15: Source of timer $1=P 1+\mathrm{P} 2+\mathrm{P} 3+\mathrm{P} 4)$
(7) Selection of RTC speed is determined by timer 1
$16-36=1$ : Timer 1 is enabled.
Frequency setting is speed-stage 0 (05-01).
Rotation direction (16-37) is set to 0000b.
Then, the rotation direction of time period 1~4 (P1~P4) is corresponding to the setting of 16-37.
(8) Choose two constant speeds (speed 1 \& speed 2)
$16-36=5$ : Timer $1+2$ is enabled.
When timer 1 is enabled, frequency setting is speed-stage 1 ; while timer 2 is enabled, frequency setting is speed-stage 2.
Rotation direction (16-37) is set to 0000b.
Then, when timer 1 and timer 2 are active, direction of motor rotation is forward rotation.

Note: Select RTC offset (16-30) and set RTC offset time (16-31) to enable the offset time. Inverter runs depending on the arranging time period to timer function. Refer to the following Fig.4.4.88.

Figure 4.4.88 Operation of offset time

For example:

## Inverter runs at the time period exclusive P 1 :

When 16-36=1 (selection of RTC speed is set to timer 1) and 16-32=17 (offset + PI), RTC offset (16-30) is set by DI and the offset time is set via 16-31. Switch on DI and RTC will immediately start up.

If the source of timer is set to 15 (P1+P2+P3+P4), press "STOP" key at the time period 1 (P1). Normally, RTC will start automatically at the next time period (P2) but it can also start via the setting of 16-30 to 2 (set by DI). Inverter re-runs when switching on DI and RTC will immediately start up.

## Notes:

If press "STOP" key at the time period and inverter can re-run at this time, user can:

- Set the selection of RTC offset (16-30) to 2 (set by DI) and set DI to 56 (RTC Offset Enable).
- Switch the selection of RTC offset $(16-30)$ to be enabled.

## Note:

RTC Accuracy:

| Temperature | Deviation |
| :---: | :---: |
| $+25^{\circ} \mathrm{C}\left(77^{\circ} \mathrm{F}\right)$ | $+/-3$ sec. $/$ day |
| $-20 /+50^{\circ} \mathrm{C}\left(-4 / 122^{\circ} \mathrm{F}\right)$ | $+/-6 \mathrm{sec} . /$ day |

＊1．Values of motor rated voltage are for 200 V class，double the values for 400 V class．
＊2．The setting range of motor rated frequency is 0.0 to 599.0 Hz ．

## Auto-tuning

Based on the motor nameplate set the motor rated output power (17-01), motor output rated current (17-02), motor rated voltage (17-03), motor rated frequency (17-04), motor rated speed (17-05) and number of motor poles (17-06) to perform an auto-tune.

- Automatic tuning mode selection (17-00)

17-00=0: Perform rotational auto-tune (High performance auto-tune)
After executing Rotational auto-tuning (17-00), Excitation current (02-09), Core saturation coefficient 1 (02-10), Core saturation coefficient 2 and Core saturation coefficient 3 will renew the value.
17-00=1: Perform a static non-rotational auto-tune
Motor does not rotate during auto-tuning and this tuning causes lower power at low speed.
After executing Static auto-tuning (17-00=1), Proportion of motor leakage inductance (02-33) and Motor slip (02-34) will renew the value.
17-00=2: Perform stator resistance non-rotational auto-tune (V/F mode) when using long motor leads. This tuning causes lower power at low speed.

After executing Stator resistance measurement (17-00=2), Resistance between wires (02-15) will renew the value.

## 17-00=3: Reserved

17-00=4: Loop tuning makes optimization for current loop response to improve the bandwidth of urrent and torque.

17-00=5: Rotational auto-tuning combination is three-in-one auto-tuning, including loop tuning $(17-00=4)$, stator resistance measurement $(V / F)(17-00=2)$, and rotation auto-tuning (17-00=0).

17-00=6: Static auto-tuning combination () is three-in-one auto-tuning, including loop tuning (17-00=4), stator resistance measurement (V/F) (17-00=2) and static auto-tuning (17-00=1).

- Motor rated output power (17-01)

Set by inverter capacity (13-00)

- Motor rated current (17-02)

Set by inverter capacity (13-00)
Set the range to $10 \% \sim 200 \%$ of the inverter rated current.

- Motor rated voltage (17-03)
- Motor rated frequency (17-04)
- Motor rated speed (17-05)

When tuning a special motor (e.g. constant power motor, high-speed spindle motor), with a motor rated voltage or rated motor frequency that is lower than a standard AC motor, it is necessary to confirm the motor nameplate information or the motor test report.

Prevent the inverter output voltage from saturation when the motor rated voltage is higher than the inverter input voltage (see Example 1).

Example 1: Motor rated voltage $(440 \mathrm{~V} / 60 \mathrm{~Hz})$ is higher than the inverter input voltage $(380 \mathrm{~V} / 50 \mathrm{~Hz})$.

Figure 4.4.89 Rated voltage and frequency settings
Step 1: Set motor rated voltage, 17-03=440V.
Step 2: Set no-load voltage, $17-08=360 \mathrm{~V}$, lower the input voltage by 20 V when operating in torque control.
Step 3: Set motor rated frequency:
$17-04=$ (Rated frequency of motor nameplate) $X \frac{\text { (Inverter input power voltage) }}{\text { (Rated frequency of motor nameplate) }}=60 \mathrm{~Hz} \times \quad \frac{380 \mathrm{~V}}{440 \mathrm{~V}}=51.8 \mathrm{~Hz}$
Step 4: Automatically tuning
Parameter 01-12 (Fbase) is automatically set during auto-tuning. Parameter 01-12 (Fbase) is set to the motor rated frequency.

Step 5: Set the 01-12 (Fbase) to the motor rated frequency on the motor nameplate. If the maximum output frequency ( $01-02$, Fmax) and base frequency ( $01-12$, Fbase) are different, set the maximum output frequency when the auto- tuning (01-02, Fmax) is completed.

When the inverter input voltage (or frequency) is higher than the motor rated voltage (or frequency), set the motor rated voltage (17-03) and the motor rated frequency (17-04) to the rated frequency on the motor nameplate.

Example 2: The inverter input voltage and frequency $(440 \mathrm{~V} / 50 \mathrm{~Hz})$ are higher than the motor rated voltage and frequency $(380 \mathrm{~V} / 33 \mathrm{~Hz}$ ), set $17-03$ to 380 V (rated motor voltage) and $17-04$ to 33 Hz (motor rated frequency).

- Number of poles (17-06)

Set the motor pole number with its range is $2,4,6,8$ and 16 poles. (It is only $2 \sim 8$ poles in inverter software V1.3.

- Motor no-load voltage (17-08)
a) Motor no-load voltage is mainly used in SLV mode, set to value $10 \sim 50 \mathrm{~V}$ lower than the input voltage to ensure good torque performance at the motor rated frequency.
b) Set to $85 \sim 95 \%$ of the motor rated voltage. In general, the no-load voltage can be closer to the motor rated voltage for larger motors, but cannot exceed the motor rated voltage.
c) The motor no-load voltage can be set to a value greater than the actual input voltage. In this case, the motor can only operates under relatively low frequency. If the motor operates at the rated frequency an over voltage condition may occur.
d) The higher the motor power is, the higher the no-load voltage is.
e) A smaller no-load voltage will reduce the no-load current.
f) When load is applied the magnetic flux is weakened and the motor current increases.
g) A higher no-load voltage results in a higher the no-load current.
h) When load is applied the magnetic flux weakens and the motor current increases. Increasing the magnetic flux generates back EMF and results in poor torque control.
- Motor excitation current (17-09)
a) Only the static-type or stator resistance measurement auto-tuning (17-00=1 or 17-00=2) can be set. This data can be obtained by manual tuning. Normally, it does not require adjusting.
b) Motor excitation current is used for non-rotational auto-tuning.
c) The setting range of motor excitation current is $15 \% \sim 70 \%$ of the motor rated current.
d) If this parameter is not set, the inverter calculates the motor related parameters.
- Automatic tuning start (17-10)

Set parameter 17-10 to 1 and press ENTER the inverter will display "Atrdy" for Auto-tune ready. Next, press RUN key to start the auto-tune procedure. During auto-tuning the keypad will display "Atune "for Auto-tune in progress. When the motor is successfully tuned, the keypad shows "AtEnd".

- Error history of automatic tuning (17-11)

If auto-tuning fails the keypad will display the AtErr" message and the auto-tune cause is shown in parameter 17-11. Refer to section 5 for troubleshooting and possible automatic tuning error causes.

Note: The motor tuning error history (17-11) shows the tuning result of the last auto-tune. No error is displayed when auto-tune is aborted or when the last auto-tune was successful.

- Motor Leakage Inductance Ratio (17-12)
a) Only stator resistance measurement auto-tuning (17-00=2) can be set and this data can be obtained by manual tuning. Normally, it does not require adjustment.
b) It is mainly for non-rotational auto-tuning. The default setting is $3.4 \%$. It is required to tune to make the adjusted parameter value saved into the group 02-33.
c) If this parameter is not set, the inverter calculates the motor related parameters.
- Motor Slip Frequency (17-13)
a) Only stator resistance measurement auto-tuning ( $17-00=2$ ) can be set and this data can be obtained by manual tuning. Normally, it does not require adjustment.
b) It is mainly for non-rotational auto-tuning. The default setting is 1 Hz . It is required to tune to make the adjusted parameter value saved into the group 02-34.
c) If this parameter is not set, the inverter calculates the motor related parameters.

## Notes:

- Perform the "Stator resistance measurement" (17-00=2) auto-tune if the inverter/motor leads are longer than $167 \mathrm{ft}(50 \mathrm{~m})$.
- For the best performance in vector control perform the rotary-type automatic tune (17-00=0) first (using short motor leads between the inverter and motor) and a "Stator resistance measurement" (17-00=2) next.
- If a rotary auto-tune $(17-00=0)$ cannot be performed, manually enter the mutual induction ( $02-18$ ), excitation current (02-09), core saturation compensation factor 1-3 (02-11-02-13).
- Perform the "Stator resistance measurement" (17-00=2) in V/F control when inverter/motor leads are longer than $167 \mathrm{ft}(50 \mathrm{~m})$.
- Rotational Tuning Mode Selection (17-14)

It is only enabled in rotation auto-tuning ( $17-00=0$ ) and rotational auto-tuning combination (17-00=5).
17-14=0,
Under VF control mode, no-loading can drive general standard induction motors without oscillation. And it is the most widely used mode.

Note: If VF mode rotational tuning is failed, try Vector mode rotational tuning to run again.

17－14＝1，
Under VF control mode，no－loading drives particular induction motor with oscillation．And such kinds of motors mostly are high－speed type．

Note：Because Vector mode measures no－load current of motor by internal current vector structure，so the particular induction motor can avoid the oscillated problem in the VF control mode

## Group 18：Slip Compensation Parameters

| 18－00 | Slip Compensation Gain at Low Speed |
| :---: | :---: |
| Range | 【0．00～2．50】 |
| 18－01 | Slip Compensation Gain at High Speed |
| Range | 【－1．00～1．00】 |
| 18－02 | Slip Compensation Limit |
| Range | 【0～250】\％ |
| 18－03 | Slip Compensation Filter Time |
| Range | 【0．0～10．0】 sec |
| 18－04 | Regenerative Slip Compensation Selection |
| Range | 【0】 ：Disable <br> 【1】：Enable |
| 18－05 | FOC Delay Time |
| Range | 【1～1000】 msec |
| 18－06 | FOC Gain |
| Range | 【0．00～2．00】 |

Slip compensation automatically adjusts the output frequency based on the motor load to improve the speed accuracy of the motor mainly in V／F mode．

The slip compensation function compensates for the motor slip to match the actual motor speed to the reference frequency．

## Slip compensation adjustment in V／F mode

18－00：Slip compensation gain at low speed

The adjustment of slip compensation gain at low speed follows the below procedure：
1．Set the rated slip and the motor no－load current（02－00）．
2．Set the slip compensation（18－00）to1．0（factory default setting is 0.0 in $\mathrm{V} / \mathrm{F}$ control mode）
3．For the operation with a load attached，measure the speed and adjust the slip gain（18－00） accordingly（increase in steps of 0．1）．
－If the motor speed is lower than frequency reference，increase the value of 18－00．
－If the motor speed is higher than frequency reference，decrease the value of 18－00．
When the output current is greater than the no－load current（02－00），the slip compensation is enabled and the output frequency increases from f 1 to f 2 ．Refer to Fig．4．4．90．，the slip compensation value is calculated as follows：
［Output current（12－08）－motor no－load current（02－00）］

[^4]

Figure 4.4.90 Slip compensation output frequency
18-02: Slip compensation limit
Sets slip compensation limit in constant torque and the constant power operation (Fig.4.4.91).
If $18-02$ is $0 \%$, the slip compensation limit is disabled.

Figure 4.4.91 Slip compensation limit
When the slip compensation gain 18-00 at low speed is adjusted, and the actual motor speed is still lower than the reference frequency, the motor may be limited by the slip compensation limit.

Note: Make sure that the slip compensation limit 18-02 does not exceed the maximum allowed system limit.

18-03: Slip compensation filter
Set slip compensation filter time in V/F mode
18-04: Regenerating slip compensation selection
The selections to enable or disable the slip compensation function during regeneration.
To enable slip compensation during regeneration caused by deceleration (SLV mode), set 18-04 to 1 in case speed accuracy is required. When the slip compensation function is used regenerative energy might increase temporarily $(18-04=1)$ therefore a braking module might be required.

## SLV mode adjustment

18-00: Slip compensation gain
a) Slip compensation can be used to control the full rang speed accuracy under load condition.
b) If the speed is lower than 2 Hz and the motor speed decreases, increase the value of 18-00.
c) If the speed is lower than 2 Hz and the motor speed increases, reduce the value of 18-00.

Slip compensation gain uses a single value for the whole speed range. As a result the slip compensation accuracy at low speed is high but slight inaccuracies might occur at high speeds.

Adjust parameter 18-02 together with the compensation value or continue to adjust 18-00 if the speed accuracy at higher speed is not acceptable. Please note adjusting these parameters might impact the accuracy at lower speeds.

The impact of 18-00 on the torque and the speed are shown in Fig.4.4.92.

Figure 4.4.92 18-00 Effect on the torque and speed
18-01: Slip compensation gain at high speed

It is not required to adjust the Slip compensation gain at high speed if the motor is loaded. After adjusting parameter 18-00 it is recommended to increase the reference frequency and check the motor speed. In case of a speed error increase the value of 18-01 to adjust the compensation. Increase the motor rated frequency (01-12 base frequency) and increase the value of 18-01 to reduce the speed error. If the speed accuracy becomes worse due to an increase in motor temperature it is recommended to use a combination of 18-00 and 18-01 for adjustment.

Compared to 18-00, 18-01 serves as a variable gain for the full speed range. Parameter 18-01 determines the slip compensation at the motor rated speed and is calculated follows:

Slip compensation gain $=$ Slip compensation gain at low speed $+\longrightarrow$ [Motor rated frequency] Slip compensation

Figure 4.4.93 18-00/18-01 Slip compensation gain versus frequency reference

Figure 4.4.94 18-01 Effect on torque speed curve

18-05: FOC (Flux Orient Control) delay time

In the SLV mode, the slip compensation of the magnetic flux depends on the torque current and excitation current. If the motor load rises above $100 \%$ while running at the motor rated frequency, the motor voltage and resistance drops sharply, which may cause the inverter output to saturate and current jitter occur. The magnetic flux slip compensation will independently control the torque current and the excitation current to prevent current jitter. For slow speed or fixed speed operation, 18-05 may be increased. For fast operation adjust 18-06.

18-06: Slip compensation gain

If the motor is jittering at the rated frequency under full load, the value of 18-06 may gradually be reduced to zero to reduce current jitter.

## Group 20 Speed Control Parameters

The following figure an overview of the automatic speed regulator（ASR）block．

SLV control mode：

The ASR function adjusts the output frequency to control the motor speed to minimize the difference between the frequency reference and actual motor speed．

The ASR controller in SLV mode uses a speed estimator to estimate the motor speed．In order to reduce speed feedback signal interference，a low－pass filter and speed feedback compensator can be enabled．

The ASR integrator output can be disabled or limited. The ASR output is passed through a low-pass filter.

Figure 4.4.95 ASR block diagram (SLV mode)

## ASR setting (SLV control mode)

In SLV mode the ASR gain is divided into a high-speed and low-speed section. The speed controller has a high-speed gain 20-00/20-01 and a low-speed gain 20-02/20-03 that can be set independently.
a) The high/low switch frequency can be set with parameter 20-15 and 20-16. Similar to the ASR gain, the speed estimator has a high-speed gain 20-09/20-10 and a low-speed gain 20-11/20-12.
b) The speed estimator has a low-pass filter to reduce the speed feedback interference, parameter 20-13 and 20-14 are active at high speed as well as low speed. The switch between the high-speed and the low-speed is set by parameter 20-15 and 20-16.
c) 20-17 sets the low-speed compensation gain of the speed feedback.
d) 20-18 sets the high-speed compensation gain of the speed feedback.
e) When the frequency reference is rises above the value set in 20-16, the ASR gain used is set by parameters 20-00 and 20-01.
f) When the frequency reference falls below the value set in 20-15, the ASR gain used is set by parameters 20-02 and 20-03.
g) Gain time constant is adjusted linearly when the speed command falls within the range of $20-15$ to 20-16, for a smooth operation.

Figure 4.4.96 ASR gain setting (SLV mode)

## Tune the speed control gain

Refer to the following steps:
a. Gain adjustment of minimum output frequency

- Motor running is at minimum output frequency (Fmin, 01-08).
- Maximum ASR proportional gain 2 (20-02) will not lead to instability.
- Minimum ASR integration time 2 (20-03) will not leas to instability.
- Ensure the output current is lower than $50 \%$ of inverter rated current. If the output current is over than $50 \%$ of inverter rated current, decrease the setting value of parameter 20-02 and increase that of 20-03.
b. Gain adjustment of maximum output frequency
- Motor running is at maximum output frequency (Fmax, 01-02).
- Maximum ASR proportional gain1 (20-00) will not lead to instability.
- Minimum ASR integration time 1 (20-02) will not leas to instability.
c. Gain adjustment of accel./ decel. integral control
- When $20-07=1$, start integral control if PI speed control is enabled both at costant speed and accel./ decel..
- Integral control makes the motor speed as quickly as possible reach to the target speed but may cause overshooting or oscillation. Refer to Fig. 4.4.97 \& Fig.4.4.98.

When $20-07=1$, start ASR Proportion ( P ) and Integer ( I ) control during accel/ decel. and steady state
When $20-07=0$, start ASR Proportion ( P ) and Integer ( I ) control only during steady state and use ASR P control during accel/ decel..

Parameter 20-33 (Constant Speed Detection Level) is active mainly for the setting value of 20-07 to be 0 and frequency command source to be analog input because there will be problems occur in analog input signal if the noise causes the system judgment in not reaching the constant speed. Thus, adjust the setting value of parameter 20-33 to avoid the occurrence of the problems.

During ASR gain tuning, the multi-function analog output (AO1 and AO2 terminal) can be used to monitor the output frequency and motor speed (as shown in Fig.4.4.96).

SLV mode gain tuning (20-00~20-03, 20-09~20-18)
a) Complete the parameter tuning in normal operation.
b) Increase ASR proportional gain 1 (20-00), ASR proportional gain 2 (20-02), carefully monitor system stability.
Use parameter 20-00 and 20-02 to adjust the speed response for each cycle. Tuning the settings of 20-00, 20-02 can increase system response, but may cause system instability. See Fig.4.4.97.

Figure 4.4.97 System response of ASR proportion gain
a) Reduce ASR integral time 1(20-01), ASR integral time 2 (20-02) and carefully monitor system stability.

1. A long integral time will result in poor system response.
2. If the integral time setting is too short, the system may become unstable Refer to the following figure.

While tuning ASR P and I gain the system may overshoot and an over voltage condition can occur. A braking unit (braking resistor) can be used to avoid an over voltage condition.

Figure 4.4.98 The response of ASR integral time
Both low-speed ASR gain and the high-speed gain can be set to the same values and only require to be adjusted in case of system instability.

In case tuning of the ASR P and I gain 20-00~20-03 does not improve the system response, reduce the low-pass filter time constant 20-13~20-14 to increase the bandwidth of the feedback system and re-tune the ASR gain.

■ Tune low-speed low-pass filter time constant 20-14, make sure the reference frequency is below parameter 20-15 value.

- Tune high-speed low-pass filter time constant 20-13 at frequency reference, make sure the reference frequency is above parameter 20-16 value.
- Increasing the low-pass filter time constant can limit the bandwidth of the speed feedback system and may reduce the system response. Increasing the low-pass time reduces the speed feedback signal interference but may results in sluggish system response when the load suddenly changes. Adjust the low-pass filter time if the load stays fairly constant during normal operation. The low bandwidth of the speed feedback must be supported by the low gain of ASR to ensure the stable operation.
■ Decreasing the low-pass filter time constant may increase the bandwidth of the speed feedback and the system response. Decreasing the low-pass time may increase the speed feedback interference resulting in system instability when the load suddenly changes. Decrease the low-pass filter time is a quick system response is required for rapidly changing loads. The high bandwidth of the speed feedback allows for a relative high ASR gain.
- In case tuning 20-00 ~ 20-03 and the low-pass filter time constant 20-13 do not improve the system response time, tuning the PI gain 20-09 ~ 20-12 of the speed estimator may be required.
- Setting a high gain for the speed estimator (high proportion ( $P$ ) gain and small integral (I) time) increases the bandwidth of the speed feedback, but may cause speed feedback interference resulting in system instability.
- Setting a low gain for the speed estimator (small proportion ( P ) gain and high integral (I) time) decreases the bandwidth of the speed feedback, may improve speed feedback interference resulting in a more stable system.
- The default values for the ASR can be used in most applications, no adjustment is required. Adjusting the low-pass filter time and speed estimator gains requires a good understanding of the overall system.
- Parameter 20-15 sets the gain switch frequency at low-speed and parameter $20-16$ sets the gain switch frequency at high-speed.
■ Operating at a speed below 20-15 will result in a larger excitation current for low-speed operation accuracy. When the frequency reference rises above 20-16, the inverter will output the rated excitation current at the no-load voltage (02-19).
■ For general purpose applications parameter $20-15$ should be set to a value of $5 \sim 50 \%$ of the motor base frequency.

■ If this value is too high, the inverter output may saturate. Parameter 20-16 should be set to a value of 4 Hz or more above the value of 20-08.
■ When experiencing speed jitter at high speed and stable operation during mid-range speed while operating a heavy load ( $>100 \%$ ), it is recommended to reduce the no-load voltage ( $02-19$ ) or tune the FOC parameters (18-05 ~ 18-06).
■ Parameter 20-17 and 20-18 are for compensating speed feedback at low speed and high speed.
■ Use parameter 20-17 to adjust the torque compensation gain for the low speed range. By tuning 20-17an offset is added to the torque-speed curve. Increase 20-17 when the no-load speed is lower than the frequency reference. Decrease 20-17 when the no-load speed is higher than the frequency reference. The effect on the torque-speed curve from 20-17 is shown as the following figure:

Figure 4.4.99 Effect on the torque-speed curve from 20-17
■ Use parameter 20-18 to adjust the torque compensation gain for middle to high speed range. For most general purpose applications it is not necessary to adjust the 20-18. By tuning 20-18an offset is added to the torque-speed curve. Increase 20-18 when the no-load speed is lower than the frequency reference. Decrease 20-18 when the no-load speed is higher than the frequency reference. The effect on the torque-speed curve from 20-18 is shown as the following Fig.4.4.100.

Figure 4.4.100 Effect on the torque-speed curve from 20-17

- ASR main delay time (20-08).
a) Does not required to be adjusted for general purpose applications
b) When the set value of 20-08 is set high, the speed response will and therefore system response will decrease improving system stability.
- ASR Integral Time Limit (20-04)
a) Setting a small value may prevent system response when the load suddenly changes.

## Note:

- Response specificationsof no-load speed circuit bandwidth at vector control:

1. 50 Hz is at the control modes of SV / PMSV.
2. 10 Hz is at the control modes of SLV / PMSLV.

- Speed response will be affected by kp adjustment, inertia, load and motor temperature, etc. so that the bandwidth decrease slightly in application.

| $20-34$ | Derating of Compensation Gain |
| :---: | :--- |
| Range | $【 0.00 \sim 25600 】$ |
| $20-35$ | Derating of Compensation Time |

Derating of torque compensation function can reduce derating effect of ASR at shock load．Refer to Fig． 4．4．97 \＆Fig．4．4．98．

## 20－34 Derating of Compensation Gain：

This gain effect is the same as the proportional gain of ASR（20－00，20－02），but it is required to be with the derating compensation time（20－35）of larger speed tolerance to prevent the inverter from oscillation．

## 20－35 Derating of Compensation Time：

This time constant is used for the inhibition of oscillation caused from parameter $20-34$ ，but excessive compensation time constant leading to slower output response is unfavorable to derating compensation．

The recommended setting value of $20-34$ is $30 \sim 50$ and that of $20-35$ is $50 \sim 100 \mathrm{~ms}$ ．

## Group 21 Torque Control Parameters

| $21-05$ | Positive Torque Limit |
| :--- | :--- |
| Range | 【0～160】\％ |
| $21-06$ | Negative Torque Limit |
| Range | 【0～160】\％ |
| $21-07$ | Forward Regenerative Torque Limit |
| Range | 【0～160】\％ |
| $21-08$ | Reversal Regenerative Torque Limit |
| Range | 【0～160】\％ |

Torque limit can be set in two ways：
－Use torque limit parameters（21－05 to 21－08）to set a fixed torque limit．
－Set the torque limit by using the multi－function analog input（Al2）．

There are four torque limits that can be set separately，one for each quadrant：
（I）Positive torque limit in forward direction（21－05 positive torque limit）
（II）Positive torque limit of reverse direction（21－08 negative torque limit）
（III）Negative torque limit in reverse direction（21－06 forward regenerating torque limit）
（IV）Negative torque limit in forward direction（21－07 reversal regenerating torque limit）
Refer to Fig．4．4．101．

Figure 4．4．101 Torque limit setting
Torque limit setting by using multi－function analog input AI2（04－05）

Table 4.4.16 Torque limit analog input

| $\mathbf{0 4 - 0 5} \mathbf{( A l 2 )}$ | Function |
| :---: | :--- |
| 11 | Positive torque limit |
| 12 | Negative torque limit |
| 13 | Regenerative torque limit (for both forward and reversal directions). |
| 14 | Positive/negative torque limit (positive and negative detection torque limit ) |

Set the analog input terminal (AI2) signal level (04-00), gain (04-07) and bias (04-08)

The default setting for the analog input Al 2 is $0-10 \mathrm{~V}$ representing $0-100 \%$ of the motor rated torque).

Fig.4.4.102 shows the relationship between the output torque and the torque limit.

Figure 4.4.102 Analog input torque limit (Al2)
When the analog input is set to positive torque limit (value $=11$ ) the torque limit is active in the third and fourth quadrant.in the reverse direction (regenerative torque in the second quadrant).

When the analog input is set to negative torque limit (value =12) the torque limit is active in the third and fourth quadrant.

When the analog input is set to regenerative torque limit (value $=13$ ) the torque limit is active in the second and fourth quadrant can be controlled.

When the analog input is set to positive/negative torque limit (value $=14$ ) the torque limit is active in all four quadrants

When the analog input is at maximum ( 10 V or 20 mA ), the torque limit is $100 \%$ of the motor rated torque. In order to increase the torque limit above $100 \%$ the analog input gain (04-07) has to set to a value greater than $100 \%$. For example: $160.0 \%$ of the gain will result in the torque limit of $160 \%$ of motor rated torque at $10 \mathrm{~V}(20 \mathrm{~mA})$ analog input level.
Group 22：PM Motor Parameters－
only available when PM Control Mode is selected

| 22－00 | Rated Power of PM Motor |

| 22－18 | Flux－weakening Current Command Restriction |
| Range | 【0～120】 \％ |

The PM parameter group can be restored to factory default be initializing the inverter（13－08）．
1．PM motor rated power（22－00）；PM motor rated voltage（22－01）；PM motor rated current（22－02） Setting the motor nameplate value．
2．PM motor pole number（22－03）；PM motor rated rotation speed（22－04）；PM motor rated frequency （22－06）．Setting the motor nameplate value．For the PM motor rated rotation speed（22－04）and the PM motor rated frequency（22－06），just set one of the two and the program will automatically calculate the other．When setting the PM motor rated rotation speed（22－04），the PM motor＇s maximum rotation speed（22－05）will synchronize and update to the same setting．When using the flux－weakening function，the PM motor＇s maximum rotation speed（22－05）setting value must be revised．The formula is as follows：

20 x f （PM Motor rated frequency）
3. PM motor's maximum rotation speed (22-05)

When using the flux-weakening function, the PM motor's maximum rotation speed (22-05) must be set higher than the PM motor's rated rotation speed (22-04).
4. PM type selection (22-07)

When using the SPM motor, the recommended setting is 0 . Related adjustable parameters are the speed estimated gain (22-30) and the speed estimated filter value (22-31).
When using the IPM motor, the recommended setting is 1 . Related adjustable parameters are the speed estimated gain (22-34) and the speed estimated filter value (22-35).
5. PM SLV Start Current (22-10)

Set the torque current at start up and the unit is \% of motor rated current.
6. I/F Mode Start Frequency Switching Point (22-11)

This function is for the switching point from open-loop to close-loop in PMSLV mode. The unit is percentage for rated speed of motor .It recommends that over $5 \%$ for 400 V and over $10 \%$ for 200 V .
7. PM Armature Resistance (22-14)

Set the moto rresistance per phase in unit of $0.001 \Omega$. This parameter is automatically set under the motor auto-tuning (22-21).

Note: The motor resistance is different from the line resistance.
8. $\quad$ PM Motor D -axis Inductance (22-15)

Set motor $D$-axis inductance in unit of 0.01 mH . This parameter is automatically set under the motor auto-tuning (22-21).
9. $\quad \mathrm{PM}$ Motor Q -axis Inductance (22-16)

Set motor Q-axis inductance in unit of 0.01 mH . This parameter is automatically set under the motor auto-tuning (22-21).
10. Flux-weakening Current Command Restriction (22-18)
(1) When the MTPA's selected (22-32) setting is 0 , the setting parameter's (22-05) maximum motor rotation speed is higher than the parameter's $(22-04)$ motor rated rotation speed. This will automatically activate the flux-weakening control. Set this parameter to restrict the maximum flux-weakening capability. The unit is the motor's rated current percentage.
(2) When the MTPA's (22-32) selected setting is 2 or 3 , and the output voltage is too high, the flux-weakening voltage command restriction setting value must be raised.

SLV PM Motor Tuning（22－21）

## WARNING！

Sudden start：The inverter and motor may start unexpectedly during Auto－Tuning，which could result in death or serious injury．Make sure the area surrounding of the motor and load are clear before proceeding with Auto－Tuning．

## WARNING！Electric Shock Hazard

High voltage is supplied to the motor when performing an auto－tune，even when the motor is stopped， which could result in death or serious injury．Do not touch the motor before performing the auto－tuning procedure is completed．

## WARNING！Holding Brake

Do not perform an auto－tuning procedure when the motor is connected to a brake this may result in incorrect motor data calculation．Disconnect the motor and the load and confirm that the motor can freely run．

1．Before selecting PM motor tuning，enter the motor data（22－00）－（22－06）according to the motor
nameplate.
2.
a) Use parameter 22-21 to select tuning mode.
b) Next press the enter key to go to the PM motor tuning screen. The keypad will display the message of "IPrdy" (Ready to Tune).
c) Press run to start the PM motor tuning. The keypad will display the "IPtun" message during auto-tune.
d) If the motor is successfully tuned, the message of "IPEnd " will be displayed. If auto-tune is aborted with the stop key, the operator will display the message of " IPbrd " (PM motor tuning aborted).

## Notes:

1. Perform a magnetic pole alignment auto-tune before adjusting the speed loop.
2. It is not required to perform a magnetic pole alignment auto-tune each time the inverter is powered up.

## Fault History of SLV PM Motor Tuning (22-22)

If PM motor tuning has failed, the "IPErr" message is shown on the keypad (PM motor tuning failure). Refer to section 10 for the possible error causes and trouble shooting.

PM motor tuning fault history (22-22) only stores the result of the last auto-tune performed .If auto-tuning was successful or aborted, no error will be displayed.

## Detection Mode Selection of Default Magnetic Pole (22-25)

Select the motor activation's rotor position detection method
Method 0: Do not detect rotor position, start by directly using the angle when the motor was previously stopped
Method 1: Use input pulse signal to detect rotor position.
Method 2: Use input continuous variable frequency signal to detect rotor position.
Selection of rotor position detection mode when the motor starts:

## 22-25=0: Angle before Stop

The rotor position is not detected and the motor starts by the angle before Stop

## 22-25=1: Mode 1

Pulse input signals detect the rotor position and there is jitter in the detection process.

## 22-25=2, Mode 2

Input continuously variable frequency signals to detect the rotor position.

## Estimator Mode (22-26)

- It is suggested to set 22-26=0 when SPM motor is used. Inverter starts in I/f mode and the relevant adjustable parameters are 22-10 \& 22-11.
- It is suggested to set 22-26=1 when IPM motor is used and speed control mode is performed by the speed control ratio 1:50. Inverter will input the continuously variable frequency signal to motor and the relevant adjustable parameters are 22-27 \& 22-28.

## Mode 2 Voltage Command (22-27)

When $22-25=2$ (Mode 2), if the rotor jitters at start, it is required to tune up the set value of mode 2 voltage command to ensure the accuracy of the detection angle.

Note: When the voltage value is set too high, an overcurrent error may be occurs.

## Mode 2 Frequency Division Ratio (22-28)

When 22-25=2 (Mode 2), the input continuous signal frequency by mode 2 depends on the carrier frequency setting (parameter 11-01). It is recommended that the higher the carrier frequency is required to increase appropriately the frequency ratio to reduce the input continuous signal frequcncy so as to ensure the accuracy of the detection angle.

## Field-Weakening Voltage Control (22-29)

It is set to prevent the output voltage's saturation. This setting value performs field-weakening control depending on the inverter's input power supply and voltage to be the limitation of output voltage command. If parameter 22-18 (Flux-Weakening Control) is set too low, the inverter's output voltage will exceed the voltage command control.

## Speed Estimated Gain (22-30), Speed Estimated Filter Value (22-31)

When Estimator Mode 22-26 set to 0, adjust the speed response performance, the higher the setting value, the faster the motor reacts, however, if the setting value is too high, the control object will generate vibrations and become unstable, also, if the setting value is lower, the speed deviation will increase. Please adjust to the appropriate setting value according to the field equipment.

## MTPA Selection (22-32)

## 0: MTPA invalid

1: Distribute D-Q-axis current command according to the torque command.

## MTPA Gain (22-33)

When the default value is $200 \%$, revising the PM motor's D-axis inductance (22-15) or Q-axis inductance (22-16) (such as completing the PM motor adjustment or directly changing the inductance value) will re-calculate the MTPA Gain (22-33).

## IPM Estimator Gain (22:34)

When the estimator mode (22-26) setting is 1 , the estimator gain is the multiple of the bandwidth. The larger the setting value, the faster the motor response. However, if the value is too high, the control item will exhibit vibration and become unstable. The smaller the setting value, the greater the speed deviation. Please adjust the appropriate setting value according to the site equipment.

## Group 23 Pump \＆HVAC Function Parameters

| 23－00 | Function Selection |  |
| :---: | :---: | :---: |
| Range | 【0】 ：Disable |  |
|  | 【1】 ：Pump |  |
|  | 【2】 ：HVAC |  |
|  | 【3】：Compressor | ＊1 |

＊1：It is new added in firmware V1．4

Select function of pump or HVAC via parameter 23－00．This function is enabled if PID control mode（10－03） is enabled．Function of pump or HVAC affects PID target value and if parameter group 23 are enabled．

When 23－00＝1，LCD keypad switches automatically the main screen monitoring（16－00）to operating pressure setting（12－74），the sub－screen monitoring 1 （16－01）to pressure feedback value（12－75）and sub－screen monitoring 2 （16－02）to output frequency（12－17）．

When $23-00=2$ ，LCD keypad switches automatically the main screen monitoring（16－00）to flow meter target setting（12－77），the sub－screen monitoring 1 （16－01）to flow meter feedback（12－71）and sub－screen monitoring 2 （16－02）to output frequency（12－17）．

When $23-00=3$ ，selection of main frequency command source（00－05）can be set except PID mode and V／F curve is limited to $\mathrm{F}(01-00)$ ．Middle output voltage（01－07）is automatically set to the half of maximum output voltage and parameter 01－00 will be hidden．

## Notes：

－Refer to the setting value of parameter 23－05 for the display of LED keypad．
－When the control mode 00－00キ0（（V／F mode），the selection of 23－00＝1（Pump）or 3 （Compressor）is disabled．（It is new added in inverter software V1．4．）
Remarks 3：23－00 and 24－00 are interlocked．If selecting function selection 23－00，then you cannot select Pump Control Function Selection 24－00．Vice versa．（V1．51 Newly Added）

| 23－ 01 | Setting of Single \＆Multiple Pumps and Master \＆Alternative |
| :--- | :--- |
| Range | 【0】：Single Pump |
|  | 【1】 ：Master |
|  | 【2】 ：Slave 1 |
|  | 【3】 ：Slave 2 |
|  | 【4】：Slave 3 |

Set the inverter as the Master or Slave 1～3 via parameter 23－01．Refer to Fig．4．4．111 for the functional process of dual pump start to enable multiple pumps in parallel．It is required to reconnect to write in the parameter after it is set．

| $23-02$ | Operation Pressure Setting |
| :--- | :--- |
| Range | $【 0.10 \sim 650.00 】 \mathrm{PSI}$ |

Set the pressure value depending on the pressure transmitter of pump system after setting 10－00 to 0 （keypad given）．

| 23－03 | Maximum Pressure of Pressure Transmitter |
| :--- | :--- |
| Range | $【 0.10 \sim 650.00 】 \mathrm{PSI}$ |

Set the maximum preesure value depending on the pressure transmitter of pump system．Parameter 23－02 is limited to this maximum value．

| $23-04$ | Pump Pressure Command Source |
| :---: | :--- |
| Range | 【0】：Set by 23－02 <br> 【1】：Set by AI |
| $23-71$ | Maximum Pressure Setting |
| Range | $【 0.10 \sim 650.00 】$ PSI |

Pressure command source is given the value set by 23－02（Operation Pressure Setting）or Al．Refer to parameter 10－00 for the setting of AI terminal．

## Note：Refer to section 3．3．4．1 for single／Multi－pump wiring diagram．

23－02（Operation pressure setting）is limited by 23－71（Maximum pressure setting）．23－71 is limited by 23－03（Maximum Pressure of Pressure Transmitter）

| 23－20 | Switching of Pressure and Percentage |
| :--- | :--- |
| Range | 【0】：Pressure |
|  | 【1】：Percentage |

When 23－20＝1，
Parameters 23－09，23－24，23－34，23－38 and 23－39 are proceeding to switch percentage on the basis of parameter 23－02 and parameters 23－12 \＆23－15 are on the basis of parameter 23－03．

When 23－20＝0，
Parameters 23－09，23－24，23－34，23－38，23－39，23－12 and 23－15 is displayed and set via pressure mode．
For example， $23-02=4.00 \mathrm{PSI}, 23-03=10.00 \mathrm{PSI}, 23-09=0.5 \mathrm{PSI}, 23-12=5.00 \mathrm{PSI}$
When 23－20＝0 $\boldsymbol{\rightarrow}$ 1，
$((23-09) /(23-02))^{*} 100=>23-09=13 \%$（Rounded to integer）
$((23-15) /(23-03))^{*} 100=>23-15=50 \%$（Rounded to integer）
When 23－20＝1 $\boldsymbol{\rightarrow} 0$ ，

$$
\begin{aligned}
& ((23-09) / 100)^{*} 23-02=>23-09=0.52 \mathrm{PSI} \\
& ((23-15) / 100)^{*} 23-03=>23-15=5.00 \mathrm{PSI}
\end{aligned}
$$

| 23－36 | PUMP Unit Display | （only for LCD） |
| :---: | :---: | :---: |
| Range | 【0】：PSI |  |
|  | 【1】：FPM |  |

|  | 【9】：／m |  |

When $23-00=1$ and $23-20=0$ ，the LCD keypad dispays the unit upon the setting value by parameter 23－36 and unit diplay of parameters 12－74，12－75，23－02，23－03，23－09，23－12，23－15，23－23，23－24，23－34，23－38， $23-39$ is switched at the same time．

| $23-05$ | Display Mode Selection |
| :--- | :--- |
| Range | 【0】：Display of Target and Preesure Feedback |
|  | 【1】：Only Display Target Pressure |
|  | 【2】：Only Display Pressure Feedback |

This function can have the common display of target and feedback pressure or display separately．
（1）when 23－05＝0000：Led keypad displays pressure setting value and pressure feedback value．

## IIIII

Two－digit in the left is the pressure value setting and two－digit in the right is the pressure feedback value in the seven－segment monitor．

Note：When $23-00=2$（HVAC），the unit will be multiplied by 1000 times．If the display value is 5.0 ，it means 5000GPM（It is only displayed in inverter software V1．4．）
（2）when 23－05＝0001：Led keypad only displays the pressure setting value．

```
-пו!
IIL.U
```

（3）when 23－05＝0002 ：Led keypad only displays the pressure feedback value．

## Notes：

－Once the target value is bigger than 10，the target value is only shown as＂an integer＂instead of＂a decimal．＂10－33 is lower than 1000 and $10-34=1$ in the PID modes．
－If Pump mode is used in inverter software V1．3，parameter 23－03 is required to set to＜＝9．9 PSI．

Table 4．4．17 Guide for PID parameter adjustment

|  | Increase Setting Value | Decrease Setting Value | Main Feature |
| :---: | :---: | :---: | :---: |
| Proportional Gain（P） | （Pros）Increase response time | （Pros）Reduce jittering | Increase stabilized time |
|  | （Cons）Might cause pump jittering | （Cons）Slow down response |  |
| Integral Time（I） | （Pros）Smooth output frequency | （Pros）Fast response | For smooth feedback variations |
|  | （Cons）Slow down response | （Cons）Change rapidly output frequency |  |
| Differential Time（D） | （Pros）Avoid overshooting | （Pros）System stability | Respond to system rapid variations |
|  | （Cons）System instability or motor jittering | （Cons）Overshooting easily |  |

## Notes：

－PID parameters can be modified during the inverter is running．
－Cons：disadvantage，Pros：advantage．

Figure 4．4．104 Diagram for PID parameter adjustment

＊1：23－20＝0，presents the unit and range．
＊2：23－20＝1，presents the unit and range．

When pressure feedback value is higher than 23－02（operation pressure setting），inverter output frequency will decrease downward into sleep status．PID starts（output frequency will increase）when pressure feedback value is less than（23－02）－（23－09）．

| $23-10$ | ＊Sleep Frequency of Constant Pressure |
| :--- | :--- |
| Range | $【 0.00 \sim 599.00 】 \mathrm{~Hz}$ |

＊：（When the motor＇s maximum output frequency is over than 300 Hz ，the frequency resolution is 0.1 Hz ．）

When inverter output frequency falls below 23－10（sleep frequency of constant pressure），it starts to count the sleep time（23－11）．

| $23-11$ | Sleep Time of Constant Pressure |
| :--- | :--- |
| Range | $【 0.0 \sim 255.5 】$ Sec |

When the inverter finishes counting the sleep time（23－11），the output frequency falls downward at the deceleration time（00－15）and gets into sleep status．

Note：Parameter 23－10（sleep frequency of constant pressure）is dedicated by the pump and it is not applied to parameter 10－17（start frequency of PID sleep）．

Figure 4．4．105 Diagram for stop time of constant pressure

Note：The purpose of stop time of constant pressure is energy saving．

| $23-12$ | Maximum Pressure Limit |  |
| :--- | :--- | :--- |
| Range | $【 0.10 \sim 650.00 】$ PSI | ${ }^{*} 1$ |
|  | $【 0 \sim 100 】 \%$ | $* 2$ |

＊1： $23-20=0$ ，presents the unit and range．
＊2：23－20＝1，presents the unit and range．

It is convenient for user to limit maximum pressure．When pressure feedback value is higher than maximum pressure limit，the inverter displays warning signal and then stops．

| $23-15$ | Minimum Pressure Limit |  |
| :---: | :--- | :--- |
| Range | $【 0.00 \sim 650.00 】 \mathrm{PSI}$ | ${ }^{* 1}$ |
|  | $【 0 \sim 100 】 \%$ | ${ }^{* 2}$ |

＊1： $23-20=0$ ，presents the unit and range．
＊2： $23-20=1$ ，presents the unit and range．

It is convenient for user to limit minimum pressure．When pressure feedback value is lower than minimum pressure limit，the inverter displays warning signal and then stops．

Figure 4．4．106 Diagram for pressure feedback limit

Note：The pressure under the control of PID is between the maximum pressure limit（23－12）and minimum pressure limit（23－15）．

| 23－13 | Warning Time of High Pressure |
| :--- | :--- |
| Range | $【 0.0 \sim 600.0 】 \mathrm{Sec}$ |

When pressure feedback value is higher than maximum pressure limit，warning time of high pressure starts to count．If pressure feedback value is lower than maximum pressure limit during counting time，the warning time will recount and the inverter will display the warning signal of HIPb when the warning time ends．

| $23-14$ | Stop Time of High Pressure |
| :--- | :--- |
| Range | $【 0.0 \sim 600.0 】$ Sec |

When the warning signal of high pressure occurs and pressure feedback value is higher than maximum pressure limit，stop time of high pressure starts to count．If pressure feedback value is lower than maximum pressure limit during counting time，the stop time will recount and the inverter will display stop error signal of OPbFt when the stop time ends．

Note：When user does not want the inverter to be restricted by the maximum pressure，set 23－74＝0 （disable）to disable the function of high pressure limit．

Figure 4．4．107 Diagram for warning to stop at high pressure limit

| $23-74$ | High Pressure Setting |
| :--- | :--- |
| Range | 【0】Disable |
|  | 【1】High Pressure Warning |
|  | 【2】High Pressure Warning or Error |

## When 23－74＝0，High pressure warning or error is disabled．

When 23－74＝1，High pressure warning is enabled．High pressure error is disabled．
When 23－74＝2，High pressure warning or error is enabled．Refer to the instruction of Fig．4．4．107．

| 23－16 | Warning Time of Low Pressure |
| :--- | :--- |
| Range | $【 0.0 \sim 600.0 】$ Sec |

When pressure feedback value is lower than minimum pressure limit，warning time of low pressure starts to count．If pressure feedback value is higher than minimum pressure limit during counting time，the warning time will recount and the inverter will display the warning signal of LoPb when the warning time ends．

| $23-17$ | Fault Stop Time of Low Pressure |
| :--- | :--- |
| Range | $【 0.0 \sim 600.0 】$ Sec |

When the warning signal of low pressure occurs and pressure feedback value is lower than minimum pressure limit，stop time of low pressure starts to count．If pressure feedback value is higher than minimum pressure limit during counting time，the stop time will recount and the inverter will display stop error signal of LPbFt when the stop time ends．

Note：When user does not want the inverter to be restricted by the minimum pressure，set $23-75=0$ （disable）to disable the function of low pressure limit．

Figure 4．4．108 Diagram for warning to stop at low pressure limit

| $23-75$ | Low Pressure Setting |
| :--- | :--- |
| Range | 【0】 Disable <br> 【1】 Low Pressure Warning <br> 【2】 Low Pressure Warning or Error |

When 23－75＝0，Low pressure warning or error is disabled．
When 23－75＝1，Low pressure warning is enabled．Low pressure error is disabled．
When 23－75＝2，Low pressure warning or error is enabled．Refer to the instruction of Fig．4．4．108．

| 23－18 | Time of Loss Pressure Detection |
| :--- | :--- |
| Range | $【 0.0 \sim 600.0 】$ Sec |
| $23-19$ | Proportion of Loss Pressure Detection |
| Range | $\lfloor 0 \sim$ 100．0】 \％ |
| $23-78$ | Selection of Loss Pressure Detection |
| Range | 【0】 Disable <br>  <br>  <br>  <br>  <br> 【1】 Loss Pressure Warning <br> 【2】Low Pressure Error |

When 23－19 $=0$ or 23－78 $=0$ ，function of loss pressure detection is disabled．
When 23－19＞0，If the feedback pressure value is lower than the value of 【（23－02）x（23－19）】 and the detection time of loss pressure（23－18）passes，the inverter jumps to fault signal（FBLSS）．

When $23-78=1$ ，the inverter will display warning signal when detecting the loss pressure．
When $23-78=2$ ，the inverter will display error signal when detecting the loss pressure．

| 23－23 | Direction of Water Pressure Detection |
| :---: | :---: |
| Range | 【0】 ：Upward Detection <br> 【1】 ：Downward Detection |
| 23－24 | Range of Water Preesure Detection |
| Range | $\begin{array}{ll} \hline 【 0.0 \sim 65.00 】 \text { PSI } & { }^{* 1} \\ \lfloor 0 \sim 10 】 \% & { }^{*} 2 \\ \hline \end{array}$ |
| 23－25 | Period of Water Preesure Detection |
| Range | 【0．0～200．0】 Sec |
| 23－26 | Acceleration Time of Water Pressure Detection |
| Range | 【0．1～600．0】 Sec |
| 23－27 | Deceleration Time of Water Pressure Detection |
| Range | 【0．1～600．0】 Sec |

＊1：23－20＝0，presents the unit and range．
＊2：23－20＝1，presents the unit and range．

Acceleration time of water pressure detection（23－26）and deceleration time of water pressure detection （23－27）are corresponding to the acceleration time 2 （00－16）and the deceleration time 2 （00－17），so the setting of 23－26 changed with the setting of 00－16．Thus，avoid using multi－speed application function while using PUMP function．

Figure 4.4.109 Diagram for upward detection of water pressure
$23-25=0.0(\mathrm{sec})$ means to disable the function of water pressure detection.

When function of water pressure detection is enabled, it can shorten the time of jumping into sleep without water consumption or with mild water consumption.

If water consumption frequenctly continues, it is recommended to extend the cycle of water pressure detection (23-25) so as the detection times can be reduced and the occurance of fluttering or instability during water pressure detection in constant pressure can be avoided.

When upward detection of water pressure starts, water pressure will slightly increase. At this time, it may cause shortly pressure fluttering or instability if water consumption continues. It is recommended to reduce the range of water pressure detection (23-24) but it will extend the time of inverter jumping into sleep without water consumption or with mild water consumption.

Figure 4.4.110 Diagram for downward detection of water pressure

23-25 = 0.0 ( sec ) means to disable the function of water pressure detection.
When function of water pressure detection is enabled, it can shorten the time of inverter jumping into sleep without water consumption or with mild water consumption.

If water consumption frequenctly continues, it is recommended to extend the cycle of water pressure detection (23-25) so as the detection times can be reduced and the occurance of fluttering or instability during water pressure detection in constant pressure can be avoided.

When downward detection of water pressure starts, the output frequency will decelerate with the deceleration time of water pressure detection (23-27). Water pressure reduces with the deceleration when water consumption continues and pressure feedback value rises if the value is lower than that of target pressure value (23-02) - range of water pressure detection (23-24).

Note: It may cause shortly fluttering or instability during water detection process. User can appropriately adjust the range of water pressure detection (23-24) to avoid the occurrence of severe flutter.

Mild water consumption result in pressure reducing during deceleration and the inverter's output frequency may decrease to sleep frequency. But if pressure feedback value is lower than that of target pressure value (23-02) - range of water pressure detection (23-24), the output frequency will accelerate again.

Table 4．4．18 Guide for comparison of water pressure detection direction

|  | Pros | Cons |
| :---: | :---: | :---: |
| Upward detection of water pressure | －Keep the pressure above the target pressure during this process． <br> －For strict and precise applications | －If＂Pump lift＂is too high，operation frequency is higher without water consumption or with mild water consumption．So this detection effect is too restricted to jump into sleep． <br> －Energy－saving of water flow is not obvious and Slave is not easy to sleep under the multiple pumps in parallel． |
| Downward detection of water pressure | －Jump into sleep status without water consumption or with mild water consumption． <br> －For energy－saving purpose，under the multiple pumps in parallel regulate the pumps to the optimum operation state during this process． <br> －Startup sequency is by Master， Slave 1，Slave 2，and Slave 3. Sleep sequency is by Slave 1 ， Slave 2，and Slave 3 and Master． After the switching time is allowable，alternate Master and Slave reach the average of life expectancy． | －Pressure fluctuations may occur during this process if user inappropriately regulates the range of water pressure detection （23－24）and the deceleration time of water pressure detection（23－27）． |

| $23-28$ | ＊Foreced Run Command |
| :--- | :--- |
| Range | 【0．00 $\sim 599.00 】 \mathrm{~Hz}$ |

＊：（When the motor＇s maximum output frequency is over than 300 Hz ，the frequency resolution is 0.1 Hz ．）

This function is enabled when PID mode（10－03）is selected．

Pump will not depend on the feedback to make any PID output adjustment and runs the frequency of 00－05（Frequency command）when multi－function digital input（S1～S6）is set to 16 （PID control disable）．

And when the other digital input is set to 57 （forced frequency run），inverter sets the frequency to run depending on the parameter 23－28（forced run command）．If PID function disable is removed，the inverter is controlled by PID．

Forced run command is applied to the situation when pressure sensor disconnects，control inverter output via the external pressure sensor（ex．differential pressure switch）．

| 23－29 | Switching Time of Multiple Pumps in Parallel |
| :---: | :--- |
| Range | 【0 $\sim 240 】$ hour／min |
| $23-72$ | Switching Time of Alternation in Parallel |
| Range | 【0】：Hour |
|  | 【1】：Minute |
| $23-35$ | Selection of Multiple Pumps Shift Operation |
|  | 【0】：No function |
|  | 【1】：Timer Alternative Selection |
| Range | 【2】：Sleep Stop Alternative Selection |
|  | 【3】：Timer and Sleep Stop Alternative Selection |
|  | 【4】：Multiple Pumps Test Mode |

If function of multiple pumps in parallel is enabled，the switching way is Master $\rightarrow$ Slave $1 \rightarrow$ Slave $\rightarrow$ Slave 3 $\rightarrow$ Master $\rightarrow \ldots$ and the switching time is set via parameter 23－29．

## Parameter 23－72 Switching Time of Alternation in Parallel

23－72＝0，parameter 23－29（Switching Time of Multiple Pumps in Parallel）will be in the unit of hour．
23－72＝1，parameter 23－29（Switching Time of Multiple Pumps in Parallel）will be in the unit of minute．
Note：It will recount the time if parameter 23－29 change time and the inverter re－power up．
Selection of Multiple Pumps Shift Operation（23－35）

## 23－35＝1：Timer Alternative Selection

The Master and Slave of multiple pumps in parallel will be exchange，after the switching time of multiple pumps in parallel．

## 23－35＝2：Sleep Stop Alternative Selection

When the Master and Slave of multiple pumps in parallel are both in sleep mode，and after the detecting time（23－30），the Master and Slave of multiple pumps in parallel will be exchange．Every time the multiple pumps start，the exchange will be processed．Please refer to the diagram of sleep stop alternative selection action．

## 23－35＝3：Timer and Sleep Stop Alternative Selection

Timer alternately selected and sleep stop alternately selected will be enabled at the same time．

## 23－35＝4：Multiple Pumps Test Mode

When master stop running and the slave need to run，please set 23－35＝4，and no exchange between Master and Slave．

| 23－30 | Detection Time of Multiple Pumps in Parallel Running Start |
| :--- | :--- |
| Range | $【 0.0 \sim 30.0 】$ Sec |

When parameter $23-31$ is set to 1 or 3 ，detection time of multiple pumps in parallel running start is enabled． If water pressure can not reach the error range of constant pressure and water flow time is over the detection time（23－30），Master will inform Slave of running start．

| 23－31 | Synchronous Selection of Multiple Pumps in Parallel |
| :--- | :--- |
| Range | 【0】：Disable |
|  | 【1】：Pressure Setting and Run／Stop |
|  | 【2】：Pressure Setting |
|  | 【3】：Run／Stop |

## 23－31＝0：Disabled

## 23－31＝1：Pressure Setting and Run／Stop

Set 23－01 to 1，Pressure setting and Run／Stop command are modified by Master and Slave follows Master＇s command．Run／Stop command from Slave can be regarded as the emergency stop command with the highest priority．

## 23－31＝2：Pressure Setting

Set 23－01 to 2，Pressure setting is modified by Master and Slave follows Master＇s command to update synchronously．

## 23－31＝3：Run／Stop

Set 23－01 to 3，Run／Stop command is set by Master and Slave follows Master＇s command．Run／Stop command from Slave can be regarded as the emergency stop command with the highest priority．

## Notes:

1. When Master modifies the pressure setting, it requires pressing ENTER key to modify the pressure setting of Slave.
2. When the switching time of multiple pumps in parallel (23-29) changes and reconnection, it will recount the time.

Figure 4.4.111 Dual pumps start up process

A : Dual pumps are enabled during this time. Master starts up first and Slave is in standby to enter constant-pressure operation.
B : Large water consumption results in the higher operation frequency of Master. If water pressure is not lower than the tolerance range of constant-pressure and the operation time is not over the detection time (23-30), Slave is still in standby.
C : If it is over the detection time (23-30), and Master runs at 60 Hz , Master informs Slave of auxiliary kicking water. After Slave operates, the operation frequency of Master and Slave reduces to the operation of constant-pressure if water consumption is stable.
D : If water consumption is mild, the operation frequency of Master and Slave reduces. Because the water consumption is less than that of the operation of dual pumps, Slave stops to sleep (please refer to parameter 23-22 for dual pump slave sleep requirements) and only Master runs to reach constant-pressure operation.

## Notes:

- When 23-35=3, If the operation time is over the switching time (23-29) or sleep to stop under the operation of dual pumps, the dominance between Master and Slave will exchange to operate.
- When 23-01 $=0$, the parameter 23-01 of these two inverters can not be simultaneously set to 1 or 2 . That is, the parameter 23-01 of one inverter is set to 1 and that of the other inverter should be set to 2 and vice versa.

Note:
A : Dual pumps are enabled during this time. Higher operation pressure occurs, Master keeps operation and Slave output frequency decreases.
B : Master operation frequency maintains 60 Hz . If water pressure doesn't decrease to the target constant pressure and Slave continuously decreases to the set trip frequency (23-22), Slave detection time (23-30) starts and Slave decelerates to stop.
C : If milder water consumption and higher water pressure occur and Slave operation command is in sleep status, Master output frequency decreases to let the water pressure be in constant status when the detection time (23-30) is over.
D : When Master operation frequency decreases to the sleep frequency of constant pressure (23-10), Master will decrease to stop, water consumption is continuously mild and water pressure will reduce slowly.
E : When water consumption stops, Master jumps into sleep and the pressure remains the same. And Slave's detection time (23-30) starts.
F: When the detection time (23-30) is over, shift operation stops and virtual Master starts to become Slave. The inverter operates in constant pressure under the target pressure value.

| $23-73$ | Slave Wake－up Selection |
| :---: | :--- |
| Range | 【0】Disable |
|  | 【1】Enable |

When multiple pumps are in parallel and the requirements of slave wake－up can not be achieved in tolerance range，user can set parameter 23－73＝1 and refer to the following conditions to wake up Slave．

1．Master is in full speed operation（01－02 maximum output frequency）but pressure feedback value can not achieve the target pressure value．
2．Slave is forced to start after 30 seconds＋time of（23－30）（even if the requirement of sleep to wake－up is not achieved and the pressure feedback value is under the tolerance range of constant pressure） and keeps operations to achieve the target pressure value．
3．It is required to follow the formula（the set method 1 ）and refer to the following diagram to set the wake－up requirements．

$$
\frac{23-30}{00-14} \geq \frac{23-22}{01-02}--------------------\quad \text { set method } 1
$$

Diagram of requirements for waking up Slave

| 23－22 | Slave Trip Frequency |
| :--- | :---: |
| Range | $【 0.00 \sim 599.00 】 \mathrm{~Hz}$ |

If Master and Slave start to run at the same time，Slave will stop depend on the condition listed as below When 23－22＝0 Hz，if output frequency of Slave is lower than 23－10（Sleep Frequency of Constant Pressure）and after the time of 23－11（Sleep Time of Constant Pressure），the Slave will be stop automatically．
When 23－22＝ $1 \sim 400 \mathrm{~Hz}$（The maximum frequency follow 01－02），if the output frequency of Slave is lower than 23－22，Master will inform Slave to stop and enter sleep mode，or output frequency of Slave is lower than 23－10（Sleep Frequency of Constant Pressure）and after the time of 23－11（Sleep Time of Constant Pressure），the Slave will be stop automatically．

| 23－39 | Pressure Tolerance Range of Leakage Detection Restart | ＊3 |
| Range | 【0．01～650．00】 PSI ${ }^{*} 1$ <br> $【 1 \sim 100 】 \%$ ${ }^{*} 2$ |  |

＊1： $23-20=0$ ，presents the unit and range．
＊2：23－20＝1，presents the unit and range．
＊3：It is new added in inverter software V1．4．

Leakage Detection Case1：Pressure Variation＞23－38

Pressure Variation of Leakage Detection Restart
$\Delta \mathrm{P} 1<23-38$
$\Delta P 2>23-38$

## Notes：

－To limit single inverter to use leakage detection．
－When 23－37＝ 0.0 （ sec ），switch off this function．
－When pump is at shutdown state，pressure will drop over time if pipeline leaks．Pump will restart if pressure variation is larger than the value of parameter 23－38 in every detection time（23－37）．

Leakage Detection Case2：Pressure Variation＜23－38

## Notes：

－When 23－37＝ 0.0 （ sec ），switch off this function．
－When pump is at shutdown state，pressure will drop over time if pipeline leaks．Inverter will keep sleep state if pressure variation is lower than the value of parameter 23－38 in every detection time（23－37）and pump will restart if pressure variation is larger than that of 23－38 or pressure tolerance range is over the value of parameter 23－39 in the detection time．
－Properly adjust the relevant leakage detection parameters 23－37，23－38 and 23－39 to improve the condition of frequenct pump start and stop caused from the dropping pressure of water system due to leakage．
－Function of leakage detection is enabled only in the setting of single pump．

| $23-41$ | Local／Remote Key |
| :---: | :--- |
| Range | 【0】 $:$ Disable <br>  $\mathbf{【 1 】 : ~ E n a b l e ~}$ |

User can switch reference frequency of the inverter and give the run command in the local or remote mode．

Input source selection is determined by the source of frequency command（00－05）and the operation modes（00－02）．

When 23－41＝ 1 （Enable），you can control the LOC／REM button to switch between the LOCAL control and the Remote control．

## 23－41＝0：Disable

User can control FWD／REV key for the switch of Local／Remote key．

## 23－41＝1：Enable

Frequency command is controlled by terminal AI1 and AI2 when SEQ and REFsignal light up and run command is controlled by terminal S1，S2 or RS485．
Frequency command is controlled by the keypad when SEQ and REF signal light off．
Note：Local mode is controlled by the keypad and remote mode is controlled by control circuit terminals or RS485 connection．

| $23-42$ | Energy Recaculating |
| :---: | :--- |
| Range | 【0】：Disable（Energy Accumulating） <br> 【1】：Enable |
| $23-43$ | Electricity Price per kWh |
| Range | 【0．000～5．000】 |

When the inverter starts up，user can learn the motor accumulative output energy from parameter 12－67 （unit： kWHr ）and 12－68（unit：MWHr）．User recalculates energy via the setting of parameter 23－42 to 1.

User caculates electricity price via the setting of electricity price per kWh（23－43）and learn the accumulative electricity price from parameter 12－69 and 12－70．

| 23－44 | Selection of Accumulative Electricity Pulse Output Unit |

| 23－58 | Reaction of Low Suction |
| Range | 【0】：Disable <br> 【1】 ：Warning <br> 【2】 ：Fault <br> ［3】 ：Fault \＆Restart |

The hydraulic application can detect insufficient water in the tank resulting in low suction via HVAC function．User can select the reaction of low suction（23－58）to run command．Low suction is detected by parameter 23－54．Refer to Fig．4．4．115 for the process of low suction．

Figure 4．4．115 Diagram for the process of low suction

When 23－54＝0，detection function of low suction is disabled．
And refer to Table 4．4．19 for the detection logic of parameter 23－54 to select PID error of output current as the detection signal．

Table 4．4．19 the detection logic of low suction

| $23-54$ | Detection Signal |  |
| :---: | :---: | :---: |
|  | PID Error | Output Current |
| 1 | 1 | 0 |
| 2 | 0 | 1 |
| 3 | 1 | 1 |

The detection level is required to be set by PID error level of low suction（23－56）and output current signal （23－57）after selecting the detection signal．

The state of low suction experiences the detection time of low suction（23－55）；when it is over the detection time，low suction is active．

The reaction of low suction（23－58）is set by user to act．Refer to Table 4．4．20 for the detection signal of water used．

When 23－58＝3，refer to the instruction of parameter 07－01～07－02．Set fault auto－restart time by parameter 07－01 and the maximum number of fault auto－restart attempts is 10 by parameter 07－02．

Table 4．4．20 Detection signal of water used

| $\mathbf{2 3 - 5 8}$ | Inverter Status | Keypad Signal | Error Signal |
| :---: | :---: | :---: | :---: |
| $\mathbf{0}$ | Continous Running | None | None |
| $\mathbf{1}$ | Continous Running | LSCFT（Flash） | Warning of Low Suction |
| $\mathbf{2}$ | Stop | LSCFT | Jump to Error for Low <br> Suction |
| $\mathbf{3}$ | Stop and Restart | LSCFT | Jump to Error for Low <br> Suction and Restart |

Note：Low suction state is detected by if the signal is higher than PID error level or lower than output current．

| $23-59$ | Source of HVAC Pressure Command |
| :---: | :--- |
| Range | 【0】：Set by 23－47 |
|  | $【 1 】:$ Set by AI |

＊3：It is new added in inverter software V1．4．

23－59＝0：Target value depends on parameter 23－47．

23－59＝1：Convert the proportional target value of flow meters via Al1 input voltage value．Refer to parameter 10－00 for the setting of AI terminal．

| $23-66$ | Derating of Current Level（for Compressor Current） |
| :--- | :--- |
| Range | $【 10 \sim 200 】 \%$ |
| $23-67$ | Derating of Delay Time |
| Range | 【1．0～20．0】Sec |
| $23-68$ | Derating of Frequency Gain |
| Range | $【 1 \sim 100 】 \%$ |
| $23-69$ | OL4 Current Level |
| Range | $【 10 \sim 200 】 \%$ |
| $23-70$ | OL4 Delay Time |
| Range | $【 0.0 \sim 20.0 】$ Sec |

＊3：It is new added in inverter software V1．4．

The application of water－cooled chiller is when the rated current of compressor operates for 1 to 2 minutes easily to cause damage to compressor so the inverter is required to be set two－stage protection to protect the compressor．

## Protection of first stage：

When the inverter is at constant speed and the current is higher than the derating of current level（23－66） （this is the percentage for the rated current of compressor），it will start to count the derating of delay time （23－67）．After the counting time is over the delay one，frequency command can reach the derating of output frequency and reduce the current load via being multiplied by the derating of frequency gain（23－68）． When the current is lower than the derating of current level，output frequency will be restored to the frequency command．The action of derating to restore is counted one time．When it repeats more than three times，the output frequency will stop at the last derating frequency until the current is lower than the derating of current level（23－66）．

For example：Set $23-66=80 \%, 23-67=10 \mathrm{sec}, 23-68=90 \%$ ，the frequency command $=60 \mathrm{~Hz}$ and the rated current of compressor＝30A，then，
when the output current＝27A，higher than 24A（30A＊80\％）， 10 sec （the derating of delay time）passes，and the output frequency $=54 \mathrm{~Hz}$（frequency command $60 \mathrm{~Hz} * 90 \%$ ），the output current decreases to 25 A ，also higher than 24 A ；then another 10 sec passes， $60 \mathrm{~Hz}^{*} 81 \%=48.6 \mathrm{~Hz}$ ，the output current decreases to 23 A ， lower than 24 A ，so the output frequency is restored to 60 Hz and the current rises to 27 A ．When it repeats more than three times，the output frequency will stop at 48.6 Hz and the output current decreases to 23A．

Protection of second stage：
After the current reaches OL4 current level（23－69），the inverter will count the time at the setting value of OL4 delay time（23－70）．When the counting time ends，it will decelerate to stop automatically and display the warning signal（fault signal，OL4 Compressor Overload）．

If fault occurs，PLC can read if the inverter is running from the digital output terminals．If the inverter stops， terminate the RUN command．If $00-02=0$ ，user can press Reset key；if $00-02=1$ ，terminate the RUN command of digital input terminal to reach the effect of Reset．Then PLC can be restored to give RUN command．

Note：It is recommended that the rated current of compressor is required to be lower than that of inverter．

## Group 24 Pump Control Function Parameters

| 24－00 | Selection of Pump Control Function |
| :---: | :---: |
| Range | 【0】：Function of 1 to 8 Pump Card and 1 to 3 Relay are Disabled． <br> 【1】：Fixed Modes of Inverter Pump：First on and Last off；then Stop All． <br> 【2】：Fixed Modes of Inverter Pump：Only Stop Inverter Pump． <br> 【3】 ：Fixed Modes of Inverter Pump：First on and First Off；then Stop All． <br> 【4】 ：Cycle Modes of Inverter Pump：First on and First Off；then Stop All． <br> 【5】：Cycle Modes of Inverter Pump：Only Stop Inverter Pump． <br> 【6】： 1 to 3 Relay of Cycle Modes of Inverter Pump：First on and First off；then Stop All． <br> 【7】： 1 to 3 Relay of Cycle Modes of Inverter Pump：First on and First Off；then Stop AII．And First Boot Relay in Cycling． <br> 【8】：Cycle Modes of Inverter Pump：First on and First Off；then Stop All．And First Boot Relay in Cycling． <br> 【9】： 1 to 3 Relay of Cycle Modes of Inverter Pump：Only Stop Inverter Pump． And First Boot Relay in Cycling． |

The inverter with built-in PID controller and simple programmable logic controller (PLC) is widely applied to water supply industry. 1 to 8 pump card, mainly applied to the situation of water supply of constant pressure, dispenses the inverter from the need of an external controller.

The inverter provides the power supply of variable frequency for pump to implement the continuously variable transmission (CRT) and makes the water pressure being satbly controlled via the built-in PID controller.

There are two basic operation modes in 1 to 8 pump card:

## (1) Fixed modes of inverter pump:

Pump drived by the inverter is fixed to 1 set and maximum to 8 sets.

Figure 4.4.116 Fixed modes of inverter pump

## (2) Cycle modes of inverter pump:

Pump drived by the inverter is not fixed to 1 set and maximum to 4 sets.

Figure 4.4.117 Cycle modes of inverter pump

In addition to the two basic operation modes provided from 1 to 8 pump card, it can only use the Relay in the control board to enable the cycle modes of inverter pump.

* Cycle modes of inverter pump in the control board: Run via a Relay with a pump to start the cycle modes of inverter pump.

Figure 4.4.118 Cycle modes of inverter pump in the control board

## 24-00=0: Function of 1 to 8 pump card and 1 to 3 Relay are disabled.

## $\mathbf{2 4 - 0 0}=\mathbf{1}$ : in the fixed modes of inverter pump, first on and last off; then stop all.

Pump (motor) drived by the inverter is fixed. Switching off the pump (motor) is by the sequence of the last on and this mode is applicable to different pump (motor) ratings.

24-00=2: only inverter pump stops in the fixed modes of inverter pump.
When the inverter sends the stop command, only the pump (motor) stops but the Relay keeps on.

## 24-00=3: in the fixed modes of inverter pump, first on and first off; then stop all.

Switching off the pump (motor) is by the sequence of the first on (longer operation time) to make the pump (motor) be used for the eq ual frequency and this mode is applicable to the same pump (motor) ratings.

24-00=4: in the cycle modes of inverter pump, first on and first off; then stop all.
All the motors besides the pump are drived by the inverter and switching off the pump (motor) is by the sequence of the first on.

## 24-00=5: only inverter pump stops in the cycle modes of inverter pump.

When the inverter sends the stop command, only the pump (motor) stops but the Relay keeps on.

## 24-00=6: 1 to 3 Relay of Cycle Modes of Inverter Pump: First on and First off; then Stop All.

This mode runs via a Relay with a pump in the cycle modes of inverter pumps. If 24-07=1, only Relay in the control board is enabled in 1 to 3 Relay of cycle modes and can switch the drive sequence of every pump.

## 24-00=7: Cycle Modes of Inverter Pump: First on and First Off; then Stop All. And First Boot Relay in Cycling.

The first inverter drives the motor depending on the Relay switching time (24-08) to change the inverter's position.

## 24-00=8: Cycle Modes of Inverter Pump 1 to 3 Relay: First on and First Off; then Stop All. And First Boot Relay in Cycling.

The inverter drives the motor at the first time depending on the Relay switching time (24-08) to change the inverter's position. That is, at this mode, the inverter runs in a Relay with a pump. Users can switch the orders of each pump driving at this cycle mode of 1 to 3 Relay with the setting of parameter 24-07.

## 24-00=9 : Cycle Modes of Inverter Pump 1 to 3 Relay: Only Stop Inverter Pump. And First Boot Relay in Cycling.

As the fixed modes, first on and first off, but only stop the inverter pump. The inverter drives the motor at the first time depending on the Relay switching time (24-08) to change the inverter's position. (The Relay switching is enabled only in one motor.)

## Notes:

- When 1 to 8 pump card is not installed, it is forced to be disabled (24-00=0).
- When parameter 24-00 (pump control selection) is enabled, the selection of DI function to 16 (PID function disable) and 57 (forced frequency run) are disabled.
- Set $24-07=1$ to enable the Relay in the control board to provide the function selection of 1 to 8 pump cards, or it is still forced to be disabled.
- 1 to 8 pump cards enabled or disabled and the selection modes of water supply are determined by parameter 24-00.
- PID Setting:

PID function is enabled via the setting of PID control mode (10-03) to $x x x 1 b$ (PID enable). Set PID target value source (10-00) to 4 (10-02 given) and the target value is determined by 10-02. If the feedback value source (10-01) is set to 2 (Al2 given) and Al input signal type (04-00) is set to 0 (Al2: $0 \sim 10 \mathrm{~V}$ ), it requires to set the dip switch to V in the control board.

| 24－01 | Selection of Relay 2－4 Function |
| :---: | :---: |
| Range | 【xxx0b】：Reserved 【xxx1b】：Reserved <br> 【xx0xb】：Relay 2 Disable 【xx1xb】：Relay 2 Enable  <br> 【x0xxb】：Relay 3 Disable 【x1xxb】：Relay 3 Enable  <br> 【0xxxb】：Relay 4 Disable 【1xxxb】：Relay 4 Enable  |
| 24－02 | Selection of Relay 5－8 Function |
| Range | 【xxx0b】：Relay 5 Disable 【xxx1b】：Relay 5 Enable <br> 【xx0xb】 ：Relay 6 Disable 【xx1xb】：Relay 6 Enable <br> 【x0xxb】 ：Relay 7 Disable 【x1xxb】：Relay 7 Enable <br> 【0xxxb】：Relay 8 Disable 【1xxxb】：Relay 8 Enable |

## Fixed modes of inverter pump：

In the fixed modes of inverter pump，RY1 is permanently used and RY2～RY8 is arbitrarily selected to be used．

Inverter decelerates／accelerates to lower／upper limit frequency when user increases／decreases pumps and function of PID is temporarily disabled．When the inverter reaches lower／upper limit frequency， function of PID restores and the inverter output is determined by the feedback．

## Cycle modes of inverter pump：

In the cycle modes of inverter pump，RY2 and RY1 are always used．The rest（ $R Y 3 \sim R Y 8$ ）is a group of two， RY3／RY4，RY5／RY6，and RY7／RY8．If any one of the group is set to be disabled，this group is disabled．

The inverter output disconnects when user increases pumps．When a motor originally drived by the inverter is switched by commercial AC power supply，it requires the switching time of magnetic contactor $(24-05)$ to allow the AC power supply input．Then the inverter output drives the next motor，which is determined by the feedback．

Switch off the motor of the first on when user decreases pumps to make the pump（motor）be the equal using frequency．

## Cycle modes of inverter pump in the control board：

In the cycle modes of inverter pump，RY1 is permanently used and RY2～RY3 is arbitrarily selected to be used．24－01 can only set $0 x x x$（Relay 4 can not be set．）and 24－02 can only set 0000 （Relay 5－8 can not be set．）so this parameter will be hidden．

| $24-03$ | Duration of Upper Limit Frequency |
| :--- | :--- |
| Range | $【 1.0 \sim 600.0 】$ Sec |

Set the inverter output frequency controlled by PID reaches the upper limit frequency（the proportion setting by parameter $00-12$ ）via parameter $24-03$ ． 1 to 8 pump card controls the time required for increasing pumps．

The setting value of duration of upper limit frequency（24－03）is determined by the changing time speed of system pressure．The setting value of 24－03 is the fewer the better in the range without producing oscillation of system pressure．

| $24-04$ | Duration of Lower Limit Frequency |
| :--- | :--- |
| Range | $【 1.0 \sim 600.0 】$ Sec |

Set the inverter output frequency controlled by PID reaches the lower limit frequency（the proportion setting by parameter 00－13）via parameter 24－04． 1 to 8 pump card controls the time required for decreasing pumps．

The setting value of duration of lower limit frequency（24－04）is determined by the changing time speed of system pressure．The setting value of $24-04$ is the fewer the better in the range without producing oscillation of system pressure．

| $24-05$ | Switching Time of Magnetic Contactor |
| :--- | :--- |
| Range | $【 0.1 \sim 20.0 】$ Sec |

When a motor originally drived by the inverter is switched by the commercial AC power supply or originally drived by the commercial AC power supply is switched by the inverter，function of parameter 24－05 is used to avoid the delay of external magnetic contactor resulting in a short circuit of the inverter output and AC power supply．

The setting value of 24－05 requires being larger than the time from the switch of the inverter Relay signal to the action of external magnetic contactor．Generally，the off to on time of magnetic contactor is longer than the on to off time．Set parameter 24－05 depending on the longer time．

Figure 4．4．119 Diagram for the single cycle modes of inverter pump

| $24-06$ | Allowable Bias of Pump Switch |
| :--- | :--- |
| Range | 【0．0～20．0】\％ |

When increasing or decreasing pumps with PID control to operate in coordination with Relay card，user has to determine if it is required to increase or decrease allowable value of pump in the situation of inverter output frequency being closed to upper limit frequency（00－12）or lower limit frequency（00－13）．

The setting unit is $0.1 \%$ and if the setting is $0.0 \%$ ，inverter output frequency needs to reach the upper limit or lower limit value to increase or decrease pump（motor）．

For example， $00-12=80 \%$ ，and $00-13=20 \%$ ，then：
－If 24－06 $=0 \%$ ，when the output frequency needs to reach $80 \%$ of the maximum frequency and the period of time reach the Duration of Upper Limit Frequency（24－03），the pump（motor） increase；when the output frequency needs to reach $20 \%$ of the minimum frequency and the period of time reach the Duration of Lower Limit Frequency（24－04），the pump（motor） decrease．
－If $24-06=5 \%$ ，when the output frequency needs to reach $75 \%$ of the maximum frequency and the period of time reach the Duration of Upper Limit Frequency（24－03），the pump（motor） increase；when the output frequency needs to reach $25 \%$ of the minimum frequency and the period of time reach the Duration of Lower Limit Frequency（24－04），the pump（motor） decrease．

| $24-07$ | Pump Control Source Selection |
| :---: | :--- |
| Range | 【0】：1 to 8 Pump Card |
|  | 【1】：Built－in 1 to 3 Control Mode |

## 24－07＝0： 1 to 8 Pump Card

It is Relay in the 1 to 8 pump card used for function of inverter pump．

## 24-07 = 1: Built-in 1 to 3 Control Mode

It is Relay in the control board used for function of inverter pump.
Only R1A~R3A in the control board can be used and Relay in 1 to 8 pump card cannot be used.

It is required for the following conditions to enable this control mode.
(1) 24-00 is only set to $1 \sim 3$ and 6.
(2) 24-01 is only set to $0 x x x$ (Relay 4 is disabled).
(3) 24-02 is only set to 0000 (Relay 5~8 are disabled).

Note: If user does not follow the above requirements (24-00, 24-01, 24-02, and 24-07), errors will coour when user give commands to the inverter.

Refer to the following table for controlling the maximum value of pump under the different setting values of 24-00 and 24-07.

| Setting value <br> of 24-00 | Inverter pump <br> Modes | One pump <br> with Relay | 24-07=0 <br> (Relay in 1 to 8 pump <br> Option card) | 24-07=1 <br> (Relay in the control <br> board) |
| :---: | :---: | :---: | :---: | :---: |
| $1,2,3$ | Fixed Modes | 1 | 8 PUMP | 3 PUMP |
| $4,5,8$ | Cycle Modes | 2 | 4 PUMP | None |
| $6,7,9$ | Cycle Modes | 1 | None | 3 PUMP |

- If $24-07=1, \mathrm{R} 1 \mathrm{~A}$ is fixed to support Relay 1 controlled by pump and function of parameter 03-11 is disabled.
- If $24-07=1$ and $24-01=x x 1 x$, R2A supports Relay 2 controlled by pump and function of parameter 03-12 is disabled.
- If 24-07 = $1,24-01=x 1 x x$, R3A supports Relay 3 controlled by pump and function of parameter 03-39 is disabled.

| $24-08$ | Relay Switching Time |
| :--- | :--- |
| Range | $【 0 \sim 240 】$ hour |

Relay switching time is required to be with modes 7 or 8 of parameter $24-00$. When the power is on, the first run motor is the motor 1 . If the switching time reaches and all motor are at sleep mode, the motor 2 will start up and the inverter drives the motor 2 . Refer to the following figure for motors change when the Relay switching time reaches.

Note: It will recount time when parameter 24-00 is enabled or parameter $24-08$ changes the Relay switching time or the power reconnects.

| $24-09$ | Frequency／Target Switch |
| :--- | :--- |
| Range | 【0】Disable <br> 【1】 Enable |
| $24-10$ | Stop Mode Selection on Mode 6／7／9 |
| Range | 【0】Disable <br> 【1】 Enable |

When 24－09＝0，action of reducing pump starts from the output frequency after PID control agreeing the level of lower limit frequency and the delay time of lower limit frequency．

When 24－09＝1，action of reducing pump starts when PID feedback（12－39）＞PID setting（12－38）．

When $24-10=1$ ，all relays disconnect at stop and first relay starts to run at operation．
Note：24－10 is enabled only when 24－00＝6，7， 9.

| 24－17 | Increase and Decrease Pump Interval PID Control |
| :---: | :---: |
| Range | $【 0 】$ Increasing／Decreasing Pump Section without PID Control |
|  | 【1】Increasing／Decreasing Pump Section with PID Control |

24－17＝0：When increasing／decreasing the pump，in order to balance the current water usage，the Inverter will decelerate to the Frequency Lower Limit when increasing the pump，conversely，the Inverter will increase to Frequency Upper Limit when decreasing the pump，then the Inverter will switch back to the speed required by the PID Control．
24－17＝1：When using water at the extreme switch when increasing／decreasing the pump，and in order to balance the water usage，the Inverter Increasing／Decreasing Pump All Sections can be selected to use PID to control the Inverter Speed．

| $24-11$ | High Pressure Limit Level |
| :--- | :--- |
| Range | 【0～10000】 |
| $24-14$ | Low Pressure Limit Level |
| Range | $【 0 \sim 10000 】$ |

24－11 High Pressure Limit Level：
When pressure feedback value is higher than the set value of highp pressure limit level，the alarm signal occurs and then inverter stops the operation．

## 24－14 Low Pressure Limit Level：

When pressure feedback value is lower than the set value of low pressure limit level，the alarm signal occurs and then inverter stops the operation．

User can refer to the setting of $10-00=4$ to set the value of parameters $24-11 \& 24-14$ ．Revise the upper limit value by the setting of parameter 10－33，determine the decimal position by adjusting the setting of parameter 10－34，and the unit display by parameter 10－35．

Note: Pressure feedback value will be between the high pressure limit level (24-11) and the low pressure limit level.

| $24-12$ | Delay Time of High Pressure Warning |
| :--- | :--- |
| Range | $【 0.0 \sim 600.0 】$ Sec |
| $24-13$ | Delay Time of High Pressure Error |
| Range | $【 0.0 \sim 600.0 】$ Sec |

## 24－12 Delay Time of High pressure Warning

When pressure feedback value is higher than the high pressure limit level，high pressure warning time will start to count．If the value is lower than the high pressure limit level during the counting time，the warning time will recount．It will jump to the warning signal＂HIPb＂when the counting time is over．

## 24－13 Delay Time of High Pressure Error

When the warning signal of high pressure occurs and pressure feedback value is higher than the high pressure limit level，high pressure shutdown time will start to count．If the value is lower than the high pressure limit level during the counting time，the shutdown time will recount．It will jump to the error signal ＂OPbFt＂when the counting time is over．

Note：If user wouldn＇t like to limit to the high pressure level，the high pressure warning time can be set to zero，and then the high pressure limit function is disabled．

Diagram of high pressure limit warning to shutdown

| $24-15$ | Delay Time of Low Pressure Warning |
| :--- | :--- |
| Range | $【 0.0 \sim 600.0 】$ Sec |
| $24-16$ | Delay Time of Low Pressure Error |
| Range | $【 0.0 \sim 600.0 】$ Sec |

## 24－15 Delay Time of Low Pressure Warning

When pressure feedback value is lower than the low pressure limit level，low pressure warning time will start to count．If the value is higher than the low pressure limit level during the counting time，the warning time will recount．It will jump to the warning signal＂LoPb＂when the counting time is over．

## 24－16 Delay Time of Low Pressure Error

When the warning signal of low pressure occurs and pressure feedback value is lower than the low pressure limit level，low pressure shutdown time will start to count．If the value is higher than the low pressure limit level during the counting time，the shutdown time will recount．It will jump to the error signal ＂LPbFt＂when the counting time is over．

Note：If user wouldn＇t like to limit to the low pressure level，the low pressure warning time can be set to zero，and then the low pressure limit function is disabled．

## Diagram of low pressure limit warning to shutdown

The following examples are for the actions of increasing / decreasing pumps in the fixed modes of inverter pump. Relay $1 \sim$ Relay 4 in 1 to 8 pump card is set to be enabled. Motor 1 is connected to inverter and motor $2 \sim 4$ are connected to $A C$ power supply. MC of AC power supply is mainly controlled by the external circuit control. Refer to Fig. 4.4.126.

When $24-00=1,24-06=0$ and depending on the above PID setting, the following status occurs.
$\diamond$ Output frequency (Fout) reaches the upper limit frequency (00-12) and Fout time is over than the duration of upper limit frequency (24-03). Then Relay 2 is power on and the connected motor starts to accelerate.

Figure 4.4.120 Diagram of increasing pump in the fixed modes of inverter pump
$\triangleleft \quad$ Output frequency (Fout) decreases to the lower limit frequency (00-13) and the Fout time is over than the duration of lower limit frequency (24-04). Then Relay 4 is power off and the inverter accelerates to the upper limit frequency $(00-12)$.
$\triangleleft \quad$ When Fout reaches to the upper limit frequency (00-12), the inverter starts to decelerate.

Figure 4.4.121 Diagram of decreasing pump in the fixed modes of inverter pump

The following examples are for the actions of increasing / decreasing pumps in the cycle modes of inverter pump. Relay 1~Relay 4 in 1 to 8 pump card is set to be enabled. Refer to Fig.4.4.119 for switching of the motor connected to the inverter or AC power supply. MC of AC power supply is mainly controlled by the external circuit control. Refer to Fig.4.4.127.

When $24-00=1,24-06=0$ and depending on the above PID setting, the following status occurs.
$\diamond \quad$ Output frequency (Fout) reaches the upper limit frequency (00-12) and Fout time is over than the duration of upper limit frequency (24-03). Then Relay 1 is power off and output frequency of the inverter does not occur.
$\triangleleft \quad$ Relay 1 and Relay 2 is power on and the inverter starts to accelerate after the switching time of MC (24-05) ends.

Figure 4.4.122 Diagram of increasing pump in the cycle modes of inverter pump
$\triangleleft \quad$ Output frequency (Fout) reaches the lower limit frequency (00-13) and Fout time is over than the duration of lower limit frequency (24-04). Then Relay 1 and Relay 2 is power off
$\triangleleft \quad$ Relay 1 is power on and the inverter starts to decelerate after the switching time of MC (24-05) ends.

Figure 4.4.123 Diagram of decreasing pump in the fixed modes of inverter pump

The following examples are for the actions of increasing / decreasing pumps in 1 to 3 Relay modes. Relay 1~Relay 3 is corresponding to R1A-R3A. Refer to Fig.4.4.118 for switching of the motor connected to the inverter or AC power supply. MC of AC power supply is mainly controlled by the external circuit control. Refer to Fig.4.4.128.

When $24-00=1,24-06=0$ and depending on the above PID setting, the following status occurs.
$\diamond \quad$ Output frequency (Fout) reaches the upper limit frequency (00-12) and Fout time is over than the duration of upper limit frequency (24-03). Then Relay 1 is power off and output frequency of the inverter does not occur.
$\triangleleft \quad$ Relay 2 is power on and output frequency of the inverter does not still occur after the switching time of MC (24-05) ends.
$\triangleleft \quad$ Relay 1 is power on and the inverter starts to accelerate after the switching time of MC (24-05) ends.

Figure 4.4.124 Diagram of increasing pump in 1 to 3 Relay modes
$\diamond \quad$ When pressure feedback value is larger than the target value, output frequency (Fout) decreases. Relay 1 is power off when the output frequency reaches to the lower limit frequency (00-13) and Fout time is over than the duration of lower limit frequency (24-04).

### 4.5.3 Application Functions

## 1: Counter Function

| Symbol | Description |
| :---: | :---: |
| (1) | Counter mode (1 ~ 4) |
| (2) | UP/Down counting modes can be set by (11 ~ f8). |
|  | OFF: Count up (0, 1, 2, 3...) |
|  | ON: Count down (...3,2,1,0) |
| (3) | Use (11~f8) to reset counting value |
|  | ON: Internal count value is reset and counter output (6) is OFF |
|  | OFF: Internal counter value retained |
| (4) | Internal counter value |
| (5) | Counter compare value (AS1~AS4,MD1~MD4,T1~T8,C1~C8,V1~V8, constant) |
| (6) | Counter output ( C 1 to C 8 , there are a total of 8 counters) |

## Counter modes:

Mode 1: Counter value is locked to the set value. The value will not be retained when the power is cut off. Mode 2: Counter value is not locked. The value will not be retained when the power is cut off.
Mode 3: Counter value is locked. The value will be retained when the power is cut off.
Mode 4: Counter value is not locked. The value will be retained when the power is cut off.

## Counter mode 1

## Example:

| (5) |  |  |  |  |  |  |  |  |  | 20 |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | 0 | 0 | 0 | 1 | 1 | 2 | 2 | 1 | 1 | 0 | 19 | 19 | 20 | 20 | 20 | 0 | 20 | 20 |
| Counter input pulse |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| (2) |  |  | OFF |  |  |  |  | ON |  |  |  |  |  |  |  |  | ON |  |
| (3) |  | ON |  |  |  |  |  | OFF |  |  |  |  |  |  |  |  | ON |  |
| (6) |  |  | OFF |  |  |  |  |  |  | ON |  |  |  | ON |  |  | OFF |  |

## Input from ladder program

## Counter mode 2

|  | 20 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | 0 | 19 | 19 | 20 | 20 | 21 | 21 | 20 | 20 | 19 | 20 | 18 | 18 | 19 | 19 | 20 | 0 | 20 | 20 |

Note: In this mode the internal counter may increase past the counter compare value, unlike mode 1 where the internal counter value is limited to the counter compare value.
(1) Counter mode 3 is similar to the counter mode 1, with the exception that the counter value is saved when the drive is powered down and reloaded at power up.
(2) Counter mode 4 is similar to the counter mode 2, with the exception that the counter value is saved when the drive is powered down and reloaded at power up.

| 5 | 20 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | Mode 1 \& 2 |  | 1 | 1 | 2 | 2 |  |  |  |  |  | 0 | 1 | 1 | 2 | 2 |
| 4 | Mode 3 \& 4 |  | 1 | 1 | 2 | 2 | 3 |  |  |  |  | 3 | 4 | 4 | 5 | 5 |

| $(6)$ | Addition and subtraction modes number (AS1~AS4) |

## 6: Multiplication and division modes

RESULT ( calculation result) =V1*V2/V3

| Symbol | Description |
| :---: | :--- |
| 1$)$ | Calculation result : RESULT |
| $(2)$ | Multiplier V1(AS1~AS4,MD1~MD4,T1~T8,C1~C8,V1~V8, constant ) |
| $(3)$ | Multiplier V2(AS1~AS4,MD1~MD4,T1~T8,C1~C8,V1~V8, constant ) |
| $(4)$ | Divisor V3(AS1~AS4,MD1~MD4,T1~T8,C1~C8,V1~V8, constant ) |
| $(5)$ | Coil output of error signal (M1~MF) |
| $(6)$ | Multiplication and division modes number $\quad$ (MD1~MD4) |

### 4.6 Modbus Protocol Descriptions

### 4.6.1 Communication Connection and Data Frame

The inverter can communicate with a PC or PLC via RS485 or RS232 using the Modbus RTU or Modbus ACSII protocol. The maximum frame length is 80 bytes.

## - Network Connection

| $120 \Omega$ $1 / 4 \mathrm{w}$ |  |  |  |  |  |  | $120 \Omega$ $1 / 4 \mathrm{w}$ |

${ }^{* *}$ When several inverters are connected togerher by Modbus, please turn on the terminal resistor switch on the end inverter.
**The distance of communication line with above 200 m should have terminal resistors, which ought to be placed at both ends, so as to eliminate reflection phenomenon.

| Inverter Model | Terminal resistor switch |
| :---: | :---: |
| $220 \mathrm{~V} 1 \mathrm{HP} \sim 50 \mathrm{HP}$ | SW5 |
| 440 V 1HP~75HP |  |
| 220 V 60HP~175HP | SW4 (Standard H \& C) |
| 440 V 100HP~800HP | SW5 (Enhanced E \& G) |

- Use S (+) and S (-) terminals (only for RS-485) or CN6 connector to connect.
- CN6 Connector:

|  | Pin | Signal | Pin | Signal |
| :---: | :---: | :---: | :---: | :---: |
|  | 1 | RS-485 S+ signal | 5 | Tx signal |
|  | 2 | RS-485 S- signal | 6 | RS-485 S- signal |
|  | 3 | RS-485 S+ signal | 7 | VCC of isolated 5 V power supply |
|  | 4 | Rx signal | 8 | GND of isolated 5 V power supply |

- For RS-485 communication, use pin 1 or pin 3 for $S(+)$ and pin 2 or pin 6 for $S(-)$.

## - Data Format Frame

- Data Frame for ASCII Mode

| STX(3AH) | Start Bit = 3AH |
| :--- | :--- |
| Address Hi | Communication Address (Station): <br> 2-digit ASCII Code |
| Address Lo | Function Code (command): <br> 2-digit ASCII Code |
| Function Hi | Command Start Byte: |
| Function Lo |  |

- Data Frame for RTU Mode

Master (PLC etc.) sends request to follower (inverter), and the follower sends a response to the master (PC, PLC). The data received is illustrated here.
The data length varies depending on the command (Function).

| Node Address |
| :---: |
| Function Code |
| DATA |
| CRC CHECK |
| Signal Interval |

** The inverter response time is 10 ms .

## - Node Address

00H: Broadcast to all the drivers
01H: to the No. 01 inverter
0FH: to the No. 15 inverter
10H: to the No. 16 inverter and so on...., max to No. 254 (FEH)

## - Function Code

03H: Read the register contents
06H: Write a WORD to register
08H: Loop test
10H: Write several data to register (complex number register write)

- Checksum Calculation
- LRC
ex. NODE ADDRESS 01H
FUNCTION 03H
COMMAND 01H
+ DATA LENGTH OAH

|  |  | $0 \mathrm{FH}--------2 '$ complement |
| :---: | :---: | :--- |
| Checksum | $=$ | F1H |
| CS(H) | $=$ | $46 \mathrm{H}($ ASCII $)$ |
| CS(L) | $=$ | $31 \mathrm{H}($ ASCII $)$ |

## CRC

CRC Check: CRC code covers the content from Slave address to DATA. Please calculate it according to the following methods.
(1) Load a 16-bit register with FFFF hex (all1's). Call this CRC register.
(2) Exclusive OR the first 8-bit byte of the message, the low-order byte of the 16-bit CRC register, putting the result in the CRC register.
(3) Shift the CRC register one bit to the right (toward the LSB), Zero-filling the MSB, Extract and examines the LSB.
(4) (If the LSB was 0): Repeat Steps (3) (another shift) (If the LSB was 1): Exclusive OR the CRC register with the polynomial value A001 hex (1010 00000000 0001), putting the result in CRC register.
(5) Repeat Steps (3) and (4) until 8 shifts been performed. When this is done, a complete 8 -bit byte will be processed.
(6) Repeat Steps (2) through (5) for next 8-bit byte of the message, Continue doing this until all bytes have been processed. The final content in the CRC register is the CRC value. When sending the CRC value, the Low-order byte should be sent firstly, then the High-order byte. For example, CRC value: 1241 Hex, the high-order byte should be set to 41 hex and low-order byte 12hex.

## - CRC Calculate Program (C language)

```
    UWORD ch_sum (UBYTE long, UBYTE *rxdbuff ) {
        BYTE i = 0;
        UWORD wkg = 0xFFFF;
        while ( long-- ) {
        wkg ^= rxdbuff++;
            for (i = 0; i < 8; i++ ) {
            if (wkg & 0x0001 ) {
            wkg = ( wkg >> 1 )^ 0xa001;
        }
            else {
            wkg = wkg >> 1;
        }
    }
    }
    return( wkg );
}
```

- Exception Code

| ASCII Mode |  |
| :--- | :--- |
| STX | $\ddots '$ |
| Address | '0' |
|  | '1' |
| Function | '8' |
|  | '6' |
| Exception <br> code | $' 5 '$ |
|  | '1' |
| END | '2' |

| RTU Mode |  |  |
| :--- | :---: | :--- |
| SLAVE Address |  | 02 H |
| Function |  | 83 H |
| Exception code |  | 52 H |
| CRC-16 | High | COH |
|  | Low | CDH |

During a communication error, the inverter will respond with an Exception Code and send a message back to the main system consisting of a Function Code that is "ANDED (and 80h)" with 80 Hex.

| Exception Code | Content |
| :---: | :--- |
| 01 | Function code error |
| 02 | Register number error |
| 03 | Number error |
| 04 | DATA setting error |

### 4.6.2 Register and Data Format

- Command Data (Read / Write)

| Register No. |  | Bit | Content |  |

Note: Do not write data to a reserved register.

## - Read Holding Register [03H]

Read consecutive holding registers. The address of the first holding register is specified in the protocol.
Example: Read frequency command from the inverter with node address 1.
ASCII Mode

### 4.7 BACnet Protocol Descriptions

BACnet is in compliance with four-layer of seven-layer structure models in OSI (Open Systems Interconnection) of International Standard Organization (ISO). These four-layer structure models are application layer, network layer, data link layer and physical layer. Besides, BACnet is definced by the view of standard "object" and "property." All BACnet devices are controlled via the property of objects. Every controller with BACnet devices is considered an object collector so that every controller device can execute different kinds of functions of objects to achieve the communication control and monitor control.

### 4.7.1 BACnet Services

Services provide some commands to save or control information and some functions to achieve the purpose of monitoring and control. Namely, one BACnet device reveive certain information or command to complete specific work from other BACnet device so the two devices need to support the same service to complete communication. To complete the exchange of these service messages, these communication requirements are specified in the communication protocol of application layer by BACnet. Thus, services are parts of the communication protocol data unit (PDU) in the application layer and build the communication modes via the relationship of Server Client. Client will send the message of sevice requirements to Server and Server needs to respond to Client to execute this service. Refer to the following fugure.

All BACnet devices have the application programs to manage the requirements of device motion and executing services. Take work station for example, the application program needs to keep the display value of every input so it requires sending the service request to the object of other device to update the display value of input. The application program of the device needs to respond to the service requiremtents. Refer to the following fugure.

### 4.7.2 BACnet Protocol Structure

BACnet is the communication protocol by way of protocol stack so the pocket is composed of stacked layer types. Refer to the following figure.

When application program sends the BACnet service request for the pocket, it requires requesting for executing BACnet request program in the application layer via application program interface. The requirements of the program are sent to the application layer and application protocol data unit (APDU) consists of Application Protocol Control Information (APCI) and Servie Data of application program. Then APDU passes its messages downward to BACnet request program in the network layer. APDU becomes Network Layer Protocol Data Unit (NPDU) composed of Network Service Data Unit (NSDU) and Network Protocol Control Information (NPCI). And so forth for the data link layer and physical layer to complete the full service for the packet.

### 4.7.3 BACnet Specifications

Inverter F510 model is built-in standard BACnet MS/TP communication protocol structure to meet the demand of automatic communication equipment. Control or monitor F510 via BACnet to be allowable to read and modify specific parameter. F510 includes the following supports of standard objects:

| $\square$ Inverter Objects |  |  |
| :--- | :--- | :--- |
| Analog Input | $\square$ Analog Output | $\square$ Analog Value |
| Digital Input | $\square$ Digital Output | $\square$ Digital Value |

Refer to Table 4.7.3.1 for F510 supporting the property information of object classification. User can collect related properties of objects required via the dedicated communication software of BACnet to give control or monitor command for each object.

### 4.7.4 BACnet Object Properties

This section provides the predetermined configuration of the inverter. User can achieve the optimizazed situation at any necessary modification.

Refer to Table 4.7.4.1 for the property information of inverter objects and user can learn the inverter messages from the inverter objects.

Refer to Table 4.7.4.2 ~ Table 4.7.4.7 for the related object information that inverter supports. User can control/ read each object with the application requirements.

Table 4.7.4.1 - Inverter property list

| Property | Inverter |
| :---: | :---: |
| Object_Identifier | DEV |
| Object_Name | VFD |
| Object_Type | 8 |
| System_Status | 0 |
| Vendor_Name | VFD |

### 4.8 MetaSys N2 Communication Protocol

### 4.8.1 Introduction and Setting

This section mainly describes the communication modes of MetaSys N2 communication protocol. Connect terminal S+ and S- of hardware line RS485 and check if Baudrate setting of parameter $09-02$ is 9600 bps . If not, inverter requires reconnecting after the communication mode selection of parameter 09-01 is set to 2 (MetaSys).

### 4.8.2 MetaSys N2 Specification

| Serial Communication Interface | RS-485 |
| :---: | :---: |
| Maximum Numbers of Connection | 255 MetaSys N2 slave standard |
| Communication Speed | 9600 (BPS) |
| Data Format | - Data byte: 8 byte <br> - Stop byte: 1 byte <br> - No parity |
| Access to Data | - 15 Analog input <br> - 10 Digital input <br> - 34 Analog Output <br> - 5 Digital output |
|  | Support the following command 0/0 : Time Setting Command 0/4, 0/5 : Poll Command 0/8 : Warm Reset Command <br> 1 : Read Command <br> 2 : Write Command <br> F : Identify Device Command |
| Supporting Command | - The following Override command is enabled but it will not clear automatically after 10 minutes. <br> 7/2/3 : AO Override command <br> 7/2/4 : BO Override command <br> - The following command will respond but not execute this action. <br> $7 / 3$ : Remove Override command <br> 7/2/1 : Al Override command <br> 7/2/2 : BI Override command |

### 4.8.3 Definition of MetaSys N2 Communication Protocol

MetaSys N2 is the communication protocol developed by Johnson Control Company. MetaSys N2 communication protocol uses the configuration of Master/ Slave. Every N2 Slave device can set N2 address and the range is 1-255.

The data of N2 Slave is displayed by the object and Network Point Type (NPT) is classified to seven kinds of objects:

| No. | NPT Name | NPT <br> (abbreviation) | Description |
| :---: | :---: | :---: | :--- |
| 1 | Analog input | AI | 32-bit, IEEE- Standard floating-point |
| 2 | Binary input | BI | 1-bit |
| 3 | Analog output | AO | 32-bit, IEEE- Standard floating-point |
| 4 | Binary output | BO | 1-bit |
| 5 | Internal <br> floating-point | ADF | 32-bit, IEEE- Standard floating-point |
| 6 | Internal integer | ADI | 16-bit |
| 7 | Internal Bytes | DB | 8-bit |

The input and output are mainly for N 2 network. The input is the data from N2 Slave to N 2 network and the output is the data from N 2 network to N 2 Slave.

The object of N2 Slave has grouping and every group data can set the address of 0-255, abbreviated for NPA (Network Point Address).

Every object has its property which includes data contens (AI and AO object), object status (BI and BI object data), planning approach (if COS can respond or not) and so on. The property can read or write command but the data value of analog output and digital output requires the Override command to write in.

The object of N 2 support function of COS (output in the change of status) and if COS starts, object of $\mathrm{AO}, \mathrm{BI}$, and BO will automatically record under the data change and respond under the poll.

N2 Slave device waits for the indentify command after the inverter starts and starts for the communication with network after receiving the indentify command.

### 4.8.4. MetaSys N2 Communication Protocol in F510 Model

F510 models support four NPT, AI, AO, BI and BO but DO NOT support the following functions:

- Do not support only for the property or field that JCI used.
- Do not support functions of Analog Alarm and Analog Warning in AI. The related fields can read or write but do not have corresponding action.
- Do not support functions of OverRide in AI and BI. The inverter does not have error message for giving the OverRide command in Al and BI but do not have corresponding action.
- Support functions of OverRide in AO and BO but values of AO and BO do not restore to defult value when removing OverRide function.

The followings are the supporting properties list in $\mathrm{AI}, \mathrm{AO}, \mathrm{BI}$ and BO for F 510 models:
(1) AI Property List

| No. | Data Type | Description | Notes |
| :---: | :---: | :--- | :--- |
| 1 | Byte | Object Configuration | READ/ WRITE |
| 2 | Byte | Object Status | Only READ |
| 3 | Float | Analog Input Value | Only READ |

(2) BI Property List

| No. | Data Type | Description | Notes |
| :---: | :---: | :--- | :--- |
| 1 | Byte | Object Configuration | READ/ WRITE |
| 2 | Byte | Object Status | Only READ |

(3) AO Property List

| No. | Data Type | Description | Notes |
| :---: | :---: | :--- | :--- |
| 1 | Byte | Object Configuration | READ/ WRITE |
| 2 | Byte | Object Status | Only READ |
| 3 | Float | Current Value | READ/ OverRide |

(4) BO Property List

| No. | Data Type | Description | Notes |
| :---: | :---: | :--- | :--- |
| 1 | Byte | Object Configuration | READ/ WRITE |
| 2 | Byte | Object Status | READ/ OverRide |
| 3 | Integer | Minimum On-time | READ/ WRITE |
| 4 | Integer | Minimum On-time | READ/ WRITE |
| 5 | Integer | Maximum Cycles/Hour | READ/ WRITE |

The followings are parameters F510 models can read and write via MetaSys communication.

| Analog input property list (READ) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| No. | Object Name | F510 Parameters | Unit | Classification | Range |
| Al1 | Motor R-RPM | 02-03 Motor Rated Rotation Speed | No Units | R | $0 \sim 60000$ |

| 12 | The parameter position is only for read <br> command. |

## Chapter 5 Check Motor Rotation and Direction

This test is to be performed solely from the inverter keypad. Apply power to the inverter after all the electrical connections have been made and protective covers have been re-attached.

Important: Motor rotation and direction only applies to standard AC motors with a base frequency of 60 Hz . For 50 Hz or other frequency $A C$ motors please set the max frequency and base frequency in group 01 accordingly before running the motors.

## - LED Keypad Display

At this point, DO NOT RUN THE MOTOR, the LED keypad should display as shown below in Fig. 5.1 and all LEDs are flashing. Next press the RUN key, all LEDs light on. See Fig 5.2. The motor should now be operating at low speed running in forward (clockwise) direction. The value shown in the screen will change from 000.00 Hz to 005.00 Hz . Next press STOP key to stop the motor.

Fig 5.1: LED Keypad (Stopped)

Fig 5.2: LED Keypad (Running)

## - LCD Keypad Display

At this point, DO NOT RUN THE MOTOR, the LCD keypad should display as shown below in Fig. 5.3 and the speed reference $12-16=005.00 \mathrm{~Hz}$ should be blinking at the parameter code "12-16". Next press the RUN key, see Fig 5.4. The motor should now be operating at low speed running in forward (clockwise) direction. The parameter code 12-17 shown at the bottom left corner of the screen will change from $12-17=000.00 \mathrm{~Hz}$ to $12-17=005.00 \mathrm{~Hz}$. Next press STOP key to stop the motor.

Fig 5.3: Keypad (Stopped)

Fig 5.4: Keypad (Running)

## Notes:

- If the motor rotation is incorrect, power down the inverter.
- After the power has been turned OFF, wait at least ten minutes until the charge indicator extinguishes completely before touching any wiring, circuit boards or components.
- Using Safety precaution, and referring to section 3.8 exchange any two of the three output leads to the motor (U/T1, V/T2 and W/T3). After the wiring change, repeat this step and recheck motor direction.

## Chapter 6 Speed Reference Command Configuration

The inverter offers users several choices to set the speed reference source. The most commonly used methods are described in the next sections.

Frequency reference command is selected with parameter 00-05.

## 00-05: Main Frequency Command (Frequency Source)

This function sets the frequency command source.

Setting Range: 0 to 5
To set parameter 00-05:

- After power-up press the DSPIFUN key
- Select 00 Basic Fun
- Press READI ENTER key
- Select parameter -05 with the UPIDOWN $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ keys and press the READI ENTER key.

In the parameter list move cursor to 00-05 with the UPIDOWN keys and press READI ENTER key to select.

| $\mathbf{0 0 - 0 5}$ | Main Frequency Command Source Selection |
| :--- | :--- |
|  | 0: Keypad |
|  | 1: External Terminal (Analog Al1) |
|  | 2: Terminal Command UP / DOWN |
| Range | 3: Communication control (RS-485) |
|  | 4: Reserved |
|  | 5: Reserved |
|  | 6: RTC |
|  | 7: Al2 Auxiliary Frequency |

### 6.1 Reference from Keypad

Speed reference from the keypad is the default setting. Press the READ/ ENTER key first and use the </RESET, $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ keys to change the speed reference.

### 6.2 Reference from External Analog Signal (0-10V / 4-20mA)

Analog Reference: 0-10 V (Setting 00-05 = 1)

Analog Reference: Potentiometer / Speed Pot (Setting 00-05 = 1)

Analog Reference: 4-20mA (Setting 00-05 = 7)

### 6.3 Reference from Serial Communication RS485 (00-05=3)

To set the speed reference for the inverter via serial communication parameter 00-05 has be set to " 3 " for frequency command via serial communication.

Default Communication Setting is: Address "1", 9600 Bits/sec, 1 Start Bit, 1 Stop Bit, and No Parity

The serial communication link function uses RS485 Modbus RTU protocol and allows for:

1) Monitoring (data monitoring, function data check).
2) Frequency setting.
3) Operation command (FWD, REV, and other commands for digital input).
4) Write function data.

## Frequency Reference Command Register

Inverter Frequency Reference Register: 2502 (Hexadecimal) - Bit 0 - Bit 15: $0.00 \sim 599.00 \mathrm{~Hz}$

## Examples:

## Frequency Reference Command: $\mathbf{1 0 . 0 0 ~ H z ~ ( I n v e r t e r ~ N o d e ~ A d d r e s s : ~ 0 1 ) ~}$

Command String (hexadecimal): 0106250203 E8 23 B8
To set the frequency reference to 10.00 , a value of ' 1000 ' ( 03 E 8 h ) has to be send to the inverter.

Frequency Reference Command: $\mathbf{3 0 . 0 0} \mathrm{Hz}$ (Inverter Node Address: 01)
Command String (hexadecimal): 01062502 0B B8 2444

To set the frequency reference to 30.00 , a value of ' 3000 ' (0BB8h) has to be send to the inverter.

Frequency Reference Command: $\mathbf{6 0 . 0 0 ~ H z ~ ( I n v e r t e r ~ N o d e ~ A d d r e s s : ~ 0 1 ) ~}$

Command String (hexadecimal): 010625021770 2D 12

To set the frequency reference to 60.00, a value of ' 6000 ' (1770h) has to be send to the inverter
Note: The last 2 bytes of the command strings consist of a CRC16 checksum, please refer to section 4.5 of the instruction manual for additional information.

### 6.4 Reference from two Analog Inputs

Analog input Al1 is used as master frequency reference and analog input AI2 is used as auxiliary frequency reference.

Analog Reference Al1: 0-10 V (Setting 00-05 = 1)
Analog Reference AI2: 0-10 V (Setting 00-06 = 1, 04-05 = 1)

| Al1 - Analog Input 1 | Al2 - Analog Input 2 | 04-00 Setting <br> (Default = 1) | Dipswitch SW2 <br> (Default 'V') |
| :--- | :--- | :--- | :--- |
| $0 \sim 10 \mathrm{~V}$ | $0 \sim 10 \mathrm{~V}$ | 0 | Set to 'V' |
| $0 \sim 10 \mathrm{~V}$ | $4 \sim 20 \mathrm{~mA}$ | 1 | Set to 'l' |

### 6.5 Change Frequency Unit from Hz to rpm

Enter the number of motor poles in 16-03 to change the display units from Hz to rpm .

| 16-03 | Display unit |
| :---: | :---: |
| Range | 0 : Display unit is Hz (Resolution is 0.01 Hz ) <br> 1: Display unit is \% (Resolution is $0.01 \%$ ) <br> 2: Rpm display; motor rotation speed is set by the control modes to select IM (02-07)/ PM (22-03) motor poles to calculate <br> 3~39: Reserved <br> 40~9999: 100\% is $X X X X$ with no decimals (integer only) <br> 10001~19999: 100\% is $X X X . X$ with 1 decimal <br> 20001~29999: 100\% is $X X . X X$ with 2 decimals <br> 30001~39999: 100\% is $X . X X X$ with 3 decimals |

Example: Motor poles 4, 02-07 or 22-03 = 4.

## Chapter 7 Operation Method Configuration (Run / Stop)

The inverter offers users several choices to run and stop from different sources. The most commonly used methods are described in the next sections.

Operation command is selected with parameter 00-02.

## 00-02: Run Command Selection

This function sets the frequency command source.
Setting Range: 0 to 3
To set parameter 00-01:

- After power-up press the DSPIFUN key
- Select 00 Basic Fun
- Press READI ENTER key
- Select parameter -01 with the UPIDOWN $\mathbf{\Delta}$ and $\boldsymbol{\nabla}$ keys and press the READI ENTER key.

In the parameter list move cursor to 00-01 with the UPIDOWN keys and press READI ENTER key to select.

| $\mathbf{0 0 - 0 2}$ | Run Command Selection |
| :--- | :--- |
| Range | 0: Keypad control |
|  | 1: External terminal control |
|  | 2: Communication control |
|  | 3: PLC |
|  | 4: RTC |

### 7.1 Run/Stop from the Keypad (00-02=0) - Default Setting

Use the RUN key to run the drive in forward direction and the FWDIREV key to change the motor direction. (Note: to disable reverse direction set parameter 11-01 to 1)

Press STOP key to stop the inverter. (Note: Stop method can be set with parameter 07-09, default is deceleration to stop).

### 7.2 Run/Stop from External Switch I Contact or Pushbutton (00-02=1)

Use an external contact or switch to Run and Stop the inverter.

Permanent Switch / Contact

### 7.3 Run/Stop from Serial Communication RS485 (00-02=3)

To control (Run/Stop) the inverter via serial communication parameter 00-02 has be set to either a " 3 " for communication control.

Default Communication Setting is: Address "1", 9600 Bits/sec, 1 Start Bit, 1 Stop Bit, and No Parity

The serial communication link function uses RS485 Modbus RTU protocol and allows for:

1) Monitoring (data monitoring, function data check).
2) Frequency setting.
3) Operation command (FWD, REV, and other commands for digital input).
4) Write function data.

## Command Register

Inverter Command Register: 2501 (Hexadecimal)
Bit 0: Run Forward
Bit 1: Run Reverse
Bit 2 ~ Bit 15: Refer to the chapter XX of this manual

## Examples:

## Run Forward Command (Inverter Node Address: 01)

Command String (hexadecimal): 01062501000112 C6
Run Reverse Command (Inverter Node Address: 01)
Command String (hexadecimal): 0106250100039307
Stop Command (Inverter Node Address: 01)

Command String (hexadecimal): 010625010000 D3 06
Note: The last 2 bytes of the command strings consist of a CRC16 checksum, please refer to section 4.5 of the instruction manual for additional information.

## Chapter 8 Motor and Application Specific Settings

It is essential that before running the motor, the motor nameplate data matches the motor data in the inverter.

### 8.1 Set Motor Nameplate Data (02-01, 02-05)

## 02-05 Rated power of motor 1

The nominal motor rated capacity is set at the factory. Please verify that the motor name plate data matches the motor rated capacity shown in parameter 02-05. The setting should only be changed when driving a motor with a different capacity.

Range: 0.00 to $600.00 \mathrm{~kW}(1 \mathrm{HP}=0.746 \mathrm{~kW})$
To set parameter 02-05:

- After power-up press the DSP/FUN key
- Select 02 Motor Parameter
- Press READI ENTER key
- Select parameter -01 with the UPIDOWN $\boldsymbol{\Delta}$ and $\nabla$ keys and press the READ/ ENTER key.

Default values vary based on the inverter model.

## 02-01 Rated current of motor

The motor rated current is set at the factory based on the inverter model. Enter the motor rated current from the motor nameplate if it does not match the value shown in parameter 02-01.

Setting range: 0.01 to 600.00 A

To set parameter 02-01:

- After power-up press the DSP/FUN key
- Select 02 Motor Parameter
- Press READI ENTER key
- Select parameter -01 with the UPIDOWN $\mathbf{\Delta}$ and $\nabla$ keys and press the READ/ ENTER key.

### 8.2 Acceleration and Deceleration Time (00-14, 00-15)

Acceleration and Deceleration times directly control the system dynamic response. In general, the longer the acceleration and deceleration time, the slower the system response, and the shorter time, the faster the response. An excessive amount of time can result in sluggish system performance while too short of a time may result in system instability.

The default values suggested normally result in good system performance for the majority of general purpose applications. If the values need to be adjusted, caution should be exercised, and the changes should be in small increments to avoid system instability.

## 00-14 Acceleration time 1

00-15 Deceleration time 1
These parameters set the acceleration and deceleration times of the output frequency from 0 to maximum frequency and from maximum frequency to 0 .

To set parameter 00-14 or 00-15:

- After power-up press the DSPIFUN key
- Select 00 Basic Fun
- Press READI ENTER key
- Select parameter -14 or -15 with the UPIDOWN $\mathbf{\Delta}$ and $\mathbf{\nabla}$ keys and press the READI ENTER key.

Acceleration and deceleration times are represented by the three most significant (high order) digits. Set acceleration and deceleration times with respect to maximum frequency. The relationship between the set frequency value and acceleration/deceleration times is as follows:

Set Frequency $=$ Maximum Frequency

Set Frequency < Maximum Frequency

Note: If the set acceleration and deceleration times are set too low, the torque limiting function or stall prevention function can become activated if the load torque and or inertia are relatively high. This will prolong the acceleration and or deceleration times and not allow the set times to be followed. In this case the acceleration and or the deceleration times should be adjusted.

### 8.3 Torque Compensation Gain (01-10)

This parameter sets the relationship between output frequency and output voltage. Constant torque applications have the same torque requirements at low speed as well as at high speed.

## Initial Setup

For Variable Torque / Normal Duty applications set parameter 01-10 to an initial value of 0.5.

For Constant Torque / Heavy Duty applications set parameter 01-10 to an initial value of 1.0.
01-10 Torque compensation gain
This parameter sets the torque boost for motor.
Setting range: 0.0 to 2.0
To set parameter 01-10:

- After power-up press the DSPIFUN key
- Select 01 VIF Pattern
- Press READI ENTER key
- Select parameter -10 with the UPIDOWN $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ keys and press the READI ENTER key.

Increase value when:

- The wiring between the inverter and the motor very too long
- The motor size is smaller than the inverter size

Note: Gradually increase the torque compensation value and make sure the output current does not exceed inverter rated current.

Reduce value when:

- Experiencing motor vibration
- Over Current Fault
- Overload Fault

Important: Confirm that the output current at low speed does not exceed the rated output current of the inverter.
Warning: A larger than required torque compensation gain value creates over-excitation at low speeds, continued operation may cause the motor to overheat. Check the characteristics of the motor for additional information.

### 8.4 Automatic Energy Savings Function (11-19)

In the V/F control mode the automatic energy saving (AES) function automatically adjusts the output voltage and reduces the output current of the inverter to optimize energy savings based on the load.

The output power changes proportional to the motor load. Energy savings is minimal when the load exceeds $70 \%$ of the output power and savings become greater when the load decreases.

The parameter of automatic energy saving function has been set at the factory before shipment. In general, it is no need to adjust. If the motor characteristic has significant difference from TECO standard, please refer to the following commands for adjusting parameters:

## Enable Automatic Energy Savings Function

To set parameters 11-19 to 11-24:

- After power-up press the DSPIFUN key
- Select 11 Auxiliary Function Group
- Press READI ENTER key
- Select parameter - 19 to -24 with the UPIDOWN $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ keys and press the READI ENTER key.
(1) To enable automatic energy saving function set 11-19 to 1.
(2) Filter time of automatic energy saving (11-20)
(3) Commissioning parameter of energy saving (11-21 to 11-22)

In AES mode, the optimum voltage value is calculated based on the load power requirement but is also affected by motor temperature and motor characteristic.

In certain applications the optimum AES voltage needs to be adjusted in order to achieve optimum energy savings. Use the following AES parameters for manual adjustment:

11-21: Voltage limit value of AES commissioning operation
Sets the voltage upper limit during automatic energy saving. $100 \%$ corresponds to 230 V or 460 V depending on the inverter class used.

Voltage limit value of commissioning operation

11-22: Adjustment time of automatic energy saving
Sets sample time constant for measuring output power.
Reduce the value of 11-22 to increase response when the load changes.
Note: If the value of 11-22 is too low and the load is reduced the motor may become unstable.

## 11-23: Detection level of automatic energy saving

Sets the automatic energy saving output power detection level.
11-24: Coefficient of automatic energy saving
The coefficient is used to tune the automatic energy saving. Adjust the coefficient while running the inverter on light load while monitoring the output power. A lower setting means lower output voltage.

## Notes:

- If the coefficient is set to low the motor may stall.
- Coefficient default value is based on the inverter rating. Set parameter $13-00$. If the motor power does not match the inverter rating.

### 8.5 Emergency Stop

The emergency stop time is used in combination with multi-function digital input function \#14 (Emergency stop). When emergency stop input is activated the inverter will decelerate to a stop using the Emergency stop time (00-26) and display the [EM STOP] condition on the keypad.

Note: To cancel the emergency stop condition the run command has to be removed and emergency stop input deactivated.

Example: Emergency Stop Switch set for input terminal S5 (03-04 = 14).

| $\mathbf{0 0 - 2 6}$ | Emergency stop time |
| :---: | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

### 8.6 Direct / Unattended Startup

The unattended startup function prevents the inverter from starting automatically when a run command is present at time of power-up. To use USP command set one of the multi-function digital input functions to \#50 (USP Startup).

Unattended Startup Protection

### 8.7 Analog Output Setup

Signal: Use parameter 04-11 to select the analog output signal for AO1 and parameter $04-16$ to select the analog output signal for AO2.

Gain: Use parameter 04-12 to adjust the gain for AO1 and parameter 04-17 to adjust the gain for AO2. Adjust the gain so that the analog output ( $10 \mathrm{~V} / 20 \mathrm{~mA}$ ) matches $100 \%$ of the selected analog output signal (04-11 for AO1 and 04-16 for AO2).

Bias: Use parameter 04-13 to adjust the bias for AO1 and parameter 04-18 to adjust the bias for AO2. Adjust the bias so that the analog output ( $0 \mathrm{~V} / 4 \mathrm{~mA}$ ) matches $0 \%$ of the selected analog output signal (04-11 for AO1 and 04-16 for AO2).

Example: Analog Output 1 Wiring

| 04-11 | AO1 function Setting | 14: Reserved |
| :--- | :--- | :--- |
|  | 0: Output frequency | 15: ASR output |
|  | 1: Frequency command | 16: Reserved |
|  | 2: Output voltage | 17: $q$-axis voltage |
|  | 3: DC voltage | 18: $d$-axis voltage |
|  | 4: Output current | 19~20: Reserved |
|  | 5: Output power | 21: PID input |
|  | Range | Motor speed |
|  | 7: Output power factor | 22: PID output |
|  | 8: Al1 input | 23: PID target value |
|  | 9: Al2 input | 24: PID feedback value |
|  | 10: Torque command | 25: Output frequency of the soft starter |
|  | 11: $q$-axis current | 26~27: Reserved |
|  | 12: d-axis current | 28: Communication control |
|  | 13: Speed deviation |  |

| 04-12 | AO1 gain value |
| :---: | :--- |
| Range | $0.0 \sim 1000.0 \%$ |

| $\mathbf{0 4 - 1 3}$ | AO1 bias-voltage value |
| :---: | :--- |
| Range | $-100.0 \sim 100.0 \%$ |

| $\mathbf{0 4 - 1 6}$ | AO2 function Setting |
| :---: | :--- |
| Range | See parameter 04-11 |

| $\mathbf{0 4 - 1 7}$ | AO2 gain value |
| :---: | :--- |
| Range | $0.0 \sim 1000.0 \%$ |

| 04-18 | AO2 bias-voltage value |
| :---: | :--- |
| Range | $-100.0 \sim 100.0 \%$ |

| $\mathbf{0 4 - 1 9}$ | AO2 Output Signal Type |
| :--- | :--- |
|  | $0:$ AO1:0~10V AO2:0~10V |
| Range | 1: AO1:0~10V AO2:4~20mA |
|  | 2: AO1:4~20mA AO2:0~10V |
|  | 3: AO1:4~20mA AO2: $4 \sim 20 \mathrm{~mA}$ |

| $\mathbf{0 4 - 2 0}$ | Filter Time of AO Signal Scan |
| :---: | :--- |
| Range | $0.00 \sim 0.50 \mathrm{~s}$ |

Analog output level adjustment

## Chapter 9 Using PID Control for Constant Flow / Pressure Applications

### 9.1 What is PID Control?

The PID function in the inverter can be used to maintain a constant process variable such as pressure, flow, temperature by regulating the output frequency (motor speed). A feedback device (transducer) signal is used to compare the actual process variable to a specified setpoint. The difference between the set-point and feedback signal is called the error signal.

The PID control tries to minimize this error to maintain a constant process variable by regulating the output frequency (motor speed).

The amplitude of the error can be adjusted with the Proportional Gain parameter 10-05 and is directly related to the output of the PID controller, so the larger gain the larger the output correction.

## Example 1:

Gain = 1.0
Set-Point = 80\%
Feedback $=78 \%$
Error = Set-point - Feedback $=2 \%$
Control Error = Gain x Error = 2\%

Example 2:
Gain $=2.0$
Set-Point $=80 \%$
Feedback $=78 \%$
Error $=$ Set-point - Feedback $=2 \%$
Control Error = Gain x Error = 4\%

Please note that an excessive gain can make the system unstable and oscillation may occur.

The response time of the system can be adjusted with the Integral Gain set by parameter 10-06. Increasing the Integral Time will make the system less responsive and decreasing the Integral Gain Time will increase response but may result in instability of the total system.

Slowing the system down too much may be unsatisfactory for the process. The end result is that these two parameters in conjunction with the acceleration (00-14) and deceleration (00-15) times are adjusted to achieve optimum performance for a particular application.

For typical fan and pump applications a Proportional Gain (10-05) of 2.0 and an Integral Time $(10-06)$ of 5.0 sec is recommended.

## 10-03 PID control mode

PID control can be enabled by setting parameter 10-03 to ' $x x x 1 b$ '

| 10-03 | PID control mode |
| :---: | :---: |
| Range | xxx0b: PID disable <br> xxx1b: PID enable <br> xx0xb: PID positive characteristic <br> xx1xb: PID negative characteristic <br> x0xxb: PID error value of D control <br> x1xxb: PID feedback value of $D$ control <br> $0 \times x$ xb: PID output <br> 1xxxb: PID output +target value |

## Commonly used PID control modes

0001b: Forward operation: PID operation enabled, motor speeds increases when feedback signal is smaller than set-point (most fan and pump applications)

0011b: Reverse operation: PID operation enabled, motor slows down when feedback signal is smaller than set-point (e.g. level control applications)

To set parameter 10-03:

- After power-up press the DSPIFUN key
- Select 10 PID Control
- Press READI ENTER key
- Select parameter -03 with the UPIDOWN $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ keys and press the READI ENTER key.

Important: To use the PID function parameter 00-05 (Main Frequency Command Source Selection) has to be set to 5 for PID reference.

### 9.2 Connect Transducer Feedback Signal (10-01)

The PID function in the inverter
Depending on the type of feedback transducer used, the inverter can be setup for either 0-10V or a $4-20 \mathrm{~mA}$ feedback transducer.

Feedback Signal $4-20 \mathrm{~mA}(10-01=2)-\mathrm{SW} 2=1$

Feedback Signal $0-10 \mathrm{~V}(10-01=1)-S W 2=\mathrm{V}$

### 9.3 Engineering Units (only for LCD)

The PID setpoint scaling can be selected with parameter 16-03 and 16-04.
Example: 0 - 200.0 PSI Setpoint, set 16-03 to 12000 (1 decimal, range $0-200$ ) and 16-04 to 2 (PSI).

### 9.4 Sleep / Wakeup Function

The PID Sleep function can be used to prevent a system from running at low speeds and is frequently used in pumping application. The PID Sleep function is turned on by parameter 10-29 set to 1 . The inverter output turns off when the PID output falls below the PID sleep level (10-17) for the time specified in the PID sleep delay time parameter (10-18).

The inverter wakes up from a sleep condition when the PID output (Reference frequency) rises above the PID wake-up frequency $(10-19)$ for the time specified in the PID wake-up delay time (10-20).

10-29 =0: PID Sleep function is disabled.
10-29 =1: PID sleep operation is based on parameters of 10-17 and 10-18.
10-29 =2: PID sleep mode is enabled by multi-function digital input

Refer to figure 4.4.74 (a) and (b) for PID sleep / wakeup operation.

PID Sleep Function

## Chapter 10 Troubleshooting and Fault Diagnostics

### 10.1 General

Inverter fault detection and early warning / self-diagnosis function. When the inverter detects a fault, a fault message is displayed on the keypad. The fault contact output energizes and the motor will coast to stop (The stop method can be selected for specific faults).

When the inverter detects a warning / self-diagnostics error, the digital operator will display a warning or self-diagnostic code, the fault output does not energize in this case. Once the warning is removed, the system will automatically return to its original state.

### 10.2 Fault Detection Function

When a fault occurs, please refer to Table 10.2.1 for possible causes and take appropriate measures.
Use one of the following methods to restart:

1. Set one of multi-function digital input terminals (03-00, 03-05) to 17 (Fault reset); activate input
2. Press the reset button on the keypad and clear fault message.
3. Power down inverter wait until keypad goes blank and power-up the inverter again.

When a fault occurs, the fault message is stored in the fault history (see group 12 parameters).
Table 10.2.1 Fault information and possible solutions

| LED display | Description | Cause | Possible solutions |
| :---: | :---: | :---: | :---: |
| OC over current | The inverter output current exceeds the overcurrent level (around 200\% of the inverter rated current). | - Acceleration time is too short. <br> - Contactor at the inverter output side <br> - A special motor or applicable capacity is greater than the inverter rated value. <br> - Short circuit or ground fault. | - Extend acceleration time. <br> - Check the motor wiring. <br> - Disconnect motor and try running inverter. |
| $\square$ |  |  |  |
| OCA over current | The inverter output current exceeds the overcurrent level in acceleration time | - Acceleration time is too short <br> - Capacity of motor is bigger than inverter <br> - Short circuit between winding and shell of motor <br> - Short circuit between wire and ground of motor <br> - IGBT broken module | - Set the longer acceleration time <br> - Change to bigger capacity of inverter <br> - Examine motor <br> - Check the wire <br> - Replace IGBT module |
| ¢i¢ |  |  |  |
| OCC over current | The inverter output current exceeds the overcurrent level in constant speed | - Instantaneous change of load <br> - Instantaneous change of current | - Change to bigger capacity of inverter <br> - Add reactor to power source |
| CiLL |  |  |  |
| $\begin{gathered} \text { OCD } \\ \text { over current } \end{gathered}$ | The inverter output current exceeds the overcurrent level in deceleration time | - Deceleration time is too short | - Set the longer acceleration time |
| Cí口 |  |  |  |
| GF <br> Ground fault | The current to ground exceeds $50 \%$ of the inverter rated output current ( $08-23=1$, GF function is enabled). | - Motor damaged (insulation). <br> - Wire damage or deterioration. <br> - Inverter DCCT sensors defect. | - Replace motor. <br> - Check the motor wiring. <br> - Disconnect motor and try running inverter. <br> - Check resistance between cables and ground. <br> - Reduce carrier frequency. |

| OPBFT High pressure fault | High pressure fault | - Since feedback value of pump pressure is lower than limit of maximum flow. | - Check feedback signal is correct. <br> - Check if feedback value of pressure is lower than limit of maximum pressure (23-12). |
| 「11-ロ! |  |  |  |
| LSCFT <br> Low suction fault | Low suction fault | - Insufficient water supply of effluent channel leads to insufficient suction <br> - PID difference is higher than its level or current is lower than output current level | - Check if water of effluent channel is enough, and water supply is regular. <br> - Check PID difference is higher than its level or current is lower than output current level |
|  |  |  |  |
| CF00 Operator Communication Error | Errors of data transmission occur in keypad | - Keypad and inverter cannot transmit data after power on 5 seconds | - Disconnect the operator and then reconnect. <br> - Replace the control board |
| -1111 |  |  |  |
| CF01 Operator Communication Error 2 | Errors of data transmission occur in keypad | - Keypad and inverter can transmit data but transmission error occurs for more than 2 seconds | - Disconnect the operator and then reconnect. <br> - Replace the control board |
| EII 1 |  |  |  |
| CT Fault | Fault occurs in voltage level of three-phase input | - Abnormal input voltage, too much noise or malfunctioning control board | - Check input voltage signal and the voltage on the control board. |
| II |  |  |  |
| Double Communication Error | Redundant Profibus and Modbus protocol | - User may use two communication mechanisms simultaneously | - Check only one communication mechanism is used. |
| EEEII |  |  |  |
| $\begin{gathered} \text { PTC Signal } \\ \text { Loss } \end{gathered}$ | PTC Signal Loss detecting triggers error message | - PTC connection trips and has lasted for more than 10 seconds | - Check if MT terminal and GND terminal are connected. |
| PLE!5 |  |  |  |
| OPR <br> Disconnection | Run command is set to keypad mode (00-02=0). But when the inverter runs, the operator is disconnected. Selection of operator removed (16-09) determines if the inverter stops or displays fault signal. | - The inverter runs at keypad mode (00-02=0), but warning of operator being disconnected/ removed occurs. | - Check if the operator is disconnected or removed. |
|  |  |  |  |
| FBLSS <br> PID Feedback Signal Loss | When 23-19 > 0, the inverter will display fault signal on the basis of the value of feedback pressure | - Since proportion of loss pressure (23-19) is enabled and over high, the inverter trips to fault. Thus, feedback sensor cannot operate properly or is not installed correctly. | - Check if the proportion of loss pressure (23-19) is set correctly. <br> - Make sure the feedback sensor is installed correctly and PID feedback signal operates normally. |
| FLE 5 | < operation pressure setting (23-02) x detection proportion of loss pressure (23-19) and detection time of loss pressure (23-18) passed, and $23-78=2$ in the meanwhile. |  |  |
| SC Short Circuit | The inverter output or load is at short circuit. | - Short circuit or grounding fault (08-23=1) occurs from the damage to motor, insulation deterioration or cable breakage. | - Check if the load is at correct wiring. |
|  |  |  |  |

| LED display | Description | Cause | Possible solutions |
| :---: | :---: | :---: | :---: |
| PF Protection Fault | OH1 error occurs for 3 times in 5 minutes when run command in multi-function digital input terminals is not removed. | - Run command in multi-function digital input terminals is not removed. | - Remove run command in multi-function digital input terminals. |
| 口F |  |  |  |
| TOL <br> External Overload | External overload (enabled only when firemode activated | - External overload in multi-function digital input terminals. (Ex. Fan overheat) | - Check external overload. <br> - Reset external overload of digital input. |
| ELi |  |  |  |

### 10.3 Warning / Self-diagnosis Detection Function

When the inverter detects a warning, the keypad displays a warning code (flash).
Note: The fault contact output does not energize on a warning and the inverter continues operation. When the warning is no longer active the keypad will return to its original state.

When the inverter detected a programming error (for example two parameters contradict each other of are set to an invalid setting), the keypad displays a self-diagnostics code.

Note: The fault contact output does not energize on a self-diagnostics error. While a self-diagnostics code is active the inverter does not accept a run command until the programming error is corrected.

Note: When a warning or self- diagnostic error is active the warning or error code will flash on the keypad.

Refer to Table 10.3.1 for and overview, cause and corrective action for inverter warnings and self-diagnostic errors.

Table 10.3.1 Warning / self-diagnosis and corrective actions

| LED display | Description | Cause | Possible solutions |
| :---: | :---: | :---: | :---: |
|  | External base block (Terminal S6) | - Multifunction digital input external baseblock active. | - Multi-function input function set incorrectly. <br> - Check wiring |
| OL1 <br> Motor overload | Internal motor overload protection tripped, active when protection curve 08-05 = xxx1. | - Voltage setting V/F mode too high, resulting in over-excitation of the motor. <br> - Motor rated current (02-01) set incorrectly. <br> - Load too heavy. <br> - Voltage setting V/F mode too high, resulting in over-excitation of the motor. <br> - Inverter rating too small. <br> - Load too heavy. | - Check V/f curve. <br> - Check motor rated current <br> - Check and reduce motor load, check and operation duty cycle. <br> - Check V/f curve. <br> - Replace inverter with larger rating. <br> - Check and reduce motor load, check and operation duty cycle |
| Inverter overload | Inverter thermal overload protection tripped. If an inverter overload occurs 4 times in five minutes, it is required to wait 4 minutes before resetting the fault |  |  |
| 「11 |  |  |  |
| CE (flash) communication error | No Modbus communication received for 2 sec. | - Connection lost or wire broken. <br> - Host stopped | - Check connection <br> - Check host computer / |
| $2$ | Active when 09-07=3. | - communicating. | software. |

| :---: | :---: | :---: | :---: |
| Operator Writing Error | Operator cannot write the information into the inverter. | - Data control mode in operator is not consistent with that in the inverter. <br> - Data models in operator are not consistent with that in the inverter. <br> - Data firmware version in operator is not consistent with that in the inverter. |  |
| WRE* |  |  | - Check the inverter's firmware version/ control mode/ models |
| Operator Verifying Error | After operator reads or writes data in the inverter, user can verify it. If the data are not consistent, the inverter displays the signal of verifying error. | - The data in the operator and the inverter is not consistent. | - Check if the inverter is normally connected to the operator. |
| VRYE* |  |  |  |
| Repeat Run Command | The inverter is only allowed unidirectional operation and cannot operate in reverse direction simultaneously. | - Check if the external terminal is given a run command in reverse direction. | - Cancel the run command in reverse direction from the external terminal. |
| In |  |  |  |
| Operator Read Prohibit | Selection of allowing reading (16-08) is set to 0 (Do not allow to read inverter parameters and save it to the operator). | - Set parameter 16-08 to 0 . | - Set parameter 16-08 to 1 (Allow to read inverter parameters and save it to the operator). |
| RDP* |  |  |  |
| $\begin{gathered} \text { External } \\ \text { Emergency } \\ \text { Stop } \\ \hline \end{gathered}$ | Function of external emergency stop starts. | - Parameter 03-00~03-08 is set to 14 (Function of emergency stop is enabled.) | - Remove \& shutdown the run command of external emergency stop and reset it to multi-function digital input. |
| $\nabla \nabla$ |  |  |  |
| Zero Speed Stop Warning | The operation signal is enabled but frequency command is lower than the minimum output frequency (01-08) and DC brake is disabled. | - The frequency command is not set up. | - Set up the frequency command. |
| - \% - \% |  |  |  |
| Overload of Air Compressor | If the inverter's output current reaches OL4 current level (23-69), OL4 Delay Time (23-70) passed. When the count is reached, the inverter will automatically decelerate to stop and displays a warning signal. | - Since the current level (2369) is set to be over low, the inverter's output current is higher than the standard one or compressor's current is used to be over high. | - Check if the compressor load used is higher than the standard one. |
|  |  |  |  |
| PID feedback signal loss | When 23-19 > 0, the inverter will according to feedback pressure is less than (pressure transmitter maximum pressure (23-03) $x$ proportion of loss pressure detection (23-19)) value, if the pressure loss detection time (23-18) passed and 23-78 = 1 (loss of pressure detection function) will jump warning signal | - 23-19 proportion of loss pressure detection is too big <br> - Feedback sensor install failure or not work normal. ${ }^{\circ}$ | - Check 23-19 setting. <br> - Make sure correct installation and PID feedback signal. |
| E |  |  |  |

[^6]
### 10.4 Auto-tuning Error

When a fault occurs during auto-tuning of a standard AC motor, the display will show the "AtErr" fault and the motor stops. The fault information is displayed in parameter 17-11.

Note: The fault contact output does not energize with an auto-tuning fault. Refer to Table 10.4.1, for fault information during tuning, cause and corrective action.

Table 10.4.1 Auto-tuning fault and corrective actions

| Error | Description | Cause | Corrective action |
| :---: | :---: | :---: | :---: |
| 01 | Motor data input error. | - Motor Input data error during auto-tuning. <br> - Inverter output current does not match motor rated current. | - Check the motor tuning data (17-00 to 17-09). <br> - Check inverter capacity |
| 02 | Motor lead to lead resistance R1 tuning error. | - Auto-tuning is not completed within the specified time <br> - Auto-tuning results fall outside parameter setting range. <br> - Motor rated current exceeded. <br> - Motor was disconnected. | - Check the motor tuning data (17-00 to 17-09). <br> - Check motor connection. <br> - Disconnect motor load. <br> - Check inverter current detection circuit and DCCTs. <br> - Check motor installation. |
| 03 | Motor leakage inductance tuning error. |  |  |
| 04 | Motor rotor resistance R2 tuning error. |  |  |
| 05 | Motor mutual inductance Lm tuning error. |  |  |
| 07 | Deadtime compensation detection error |  |  |
| 08 | Motor acceleration error (Rotational type auto-tuning only). | - Motor fails to accelerate in the specified time (00-14= 20 sec ). | - Increase acceleration time (00-14). <br> - Disconnect motor load. |
| 09 | Other auto-tuning errors | - No load current is higher than $70 \%$ of the motor rated current. <br> - Torque reference exceeds 100\%. <br> - Errors other than ATE01~ATE08. | - Check the motor tuning data (17-00 to 17-09). <br> - Check motor connection. |

### 10.5 PM Motor Auto-tuning Error

When a fault occurs during auto-tuning of a PM motor, the display will show the "IPErr" fault and the motor stops. The fault information is displayed in parameter 22-22.

Note: The fault contact output does not energize with an auto-tuning fault. Refer to Table 10.5.1, for fault information during tuning, cause and corrective action.

Table 10.5.1 Auto-tuning fault and corrective actions for PM motor

| Error | Description | Cause | Corrective action |
| :---: | :---: | :---: | :---: |
| 01 | Magnetic pole alignment tuning failure (static). | - Inverter output current does not match motor current. | - Check the motor tuning data (22-02). <br> - Check inverter capacity |
| 02~04 | Reserved |  |  |
| 05 | Circuit tuning time out. | - System abnormality during circuit tuning. | - Check for active protection functions preventing auto-tuning. |
| 06 | Reserved |  |  |
| 07 | Other motor tuning errors. | - Other tuning errors. | - Check the motor tuning data (22-02). <br> - Check motor connection. |
| 08 | Reserved |  |  |
| 09 | Current out of range during circuit tuning. | - Inverter output current does not match motor current. | - Check the motor tuning data (22-02). <br> - Check inverter capacity |
| 10 | Reserved |  |  |
| 11 | Parameter tuning and detecting time out. | - Error relationship between voltage and current. | - Check if the setting value of parameter 22-11 is too low, but its value cannot exceed $100 \%$ of the inverter. <br> - Check motor connection. |

### 10.6 General troubleshooting

| Status | Checking point | Remedy |
| :---: | :---: | :---: |
| Motor runs in wrong direction | Is the wiring for the output terminals correct? | Wiring must match $\mathrm{U}, \mathrm{V}$, and W terminals of the motor. |
|  | Is the wiring for forward and reverse signals correct? | Check for correct wiring. |
| The motor speed can not be regulated. | Is the wiring for the analog frequency inputs correct? | Check for correct wiring. |
|  | Is the setting of operation mode correct? | Check the Frequency Source set in parameters 00-05/00-06. |
|  | Is the load too excessive? | Reduce the load. |
| Motor running speed too high or too low | Check the motor specifications (poles, voltage...) correct? | Confirm the motor specifications. |
|  | Is the gear ratio correct? | Confirm the gear ratio. |
|  | Is the setting of the highest output frequency correct? | Confirm the highest output frequency |
| Motor speed varies unusually | Is the load too excessive? | Reduce the load. |
|  | Does the load vary excessively? | 1.Minimize the variation of the load. <br> 2. Consider increasing the capacities of the inverter and the motor. |
|  | Is the input power unstable or is | 1.Consider adding an AC reactor at the power input side if using single-phase power. |
|  |  | 2.Check wiring if using three-phase power |
| Motor can not run | Is the power connected to the correct L1, L2, and L3 terminals? is the charging indicator lit? | 1.Is the power applied? <br> 2.Turn the power OFF and then ON again. <br> 3. Make sure the power voltage is correct. <br> 4.Make sure screws are secured firmly. |
|  | Is there voltage across the output terminals T1, T2, and T3? | Turn the power OFF and then ON again. |
|  | Is overload causing the motor to stall? | Reduce the load so the motor will run. |
|  | Are there any abnormalities in the inverter? | See error descriptions to check wiring and correct if necessary. |
|  | Is there a forward or reverse run command? |  |
|  | Has the analog frequency signal been input? | 1.Is analog frequency input signal wiring correct? 2.Is voltage of frequency input correct? |
|  | Is the operation mode setting correct? | Operate through the digital keypad |

### 10.7 Troubleshooting of the Inverter

### 10.7.1 Quick troubleshooting of the Inverter

### 10.7.2 Troubleshooting for OC, OL error displays

### 10.7.3 Troubleshooting for OV, LV error

### 10.7.4 The motor can not run

### 10.7.5 Motor Overheating

### 10.7.6 Motor runs unbalanced

### 10.8 Routine and periodic inspection

To ensure stable and safe operations, check and maintain the inverter at regular intervals.
Use the checklist below to carry out inspection.
Disconnect power after approximately 5 minutes to make sure no voltage is present on the output terminals before any inspection or maintenance.

| Items | Details |  | king od | Methods | Criteria | Remedies |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Daily | 1Year |  |  |  |
| Environment \& Ground connection |  |  |  |  |  |  |
| Ambient conditions at the installation | Confirm the temperature and humidity at the machine | © |  | Measure with thermometer and hygrometer | Temperature: $\begin{gathered} -10 \sim 40^{\circ} \mathrm{C} / 50^{\circ} \mathrm{C} \\ \left(14 \sim 104^{\circ} \mathrm{F}\right) /\left(122^{\circ} \mathrm{F}\right) \end{gathered}$ <br> Humidity: Below $95 \% \text { RH }$ | Improve the ambient or relocate the drive to a better area |
| Installation Grounding | Is the grounding resistance correct? |  | ( | Measure the resistance with a multi-tester | 200Vclass: below $100 \Omega$ | Improve the grounding if needed. |
| Terminals \& Wiring |  |  |  |  |  |  |
| Connection terminals | Any loose parts or terminals? |  | ( | Visual check Check with a screwdriver | Correct installation requirement | Secure terminals and remove rust |
|  | Any damage to the base ? |  | ( 0 |  |  |  |
|  | Any corroded Terminals? |  | (0) |  |  |  |
| Wiring | Any broken wires? |  | ( $)$ | Visual check | Correct wiring requirement | Rectify as necessary |
|  | Any damage to the wire insulation? |  | ( |  |  |  |
| voltage |  |  |  |  |  |  |
| Input power voltage | Is the voltage of the main circuit correct? | ( |  | Measure the voltage with a multi-tester | Voltage must conform with the spec. | Improve input voltage if necessary. |
| Circuit boards and components |  |  |  |  |  |  |
| Printed circuit board | Any contamination or damage to printed circuit board? |  | © | Visual check | Correct component condition | Clean or replace the circuit board |
| Power component | Any dust or debris |  | © |  |  | Clean component s |
|  | Check resistance between terminals |  | © | Measure with a multi-tester | No short circuit or broken circuit in three phase output | Consult with the supplier |
| Cooling System |  |  |  |  |  |  |
| Cooling fan | Unusual vibration and noise? |  | ( | Visual and sound check | Correct cooling | Consult with the supplier |
|  | Excessive dust or debris | (0) |  | Visual check |  | Clean the fan |
| Heat sink | Excessive dust or debris | ( ${ }^{\text {a }}$ |  |  |  | Clean up debris or dust |
| Ventilation Path | Is the ventilation path blocked? | (0) |  |  |  | Clear the path |

### 10.9 Maintenance

To ensure long-term reliability, follow the instructions below to perform regular inspection. Turn the power off and wait for a minimum of 5 minutes before inspection to avoid potential shock hazard from the charge stored in high-capacity capacitors.

## 1. Maintenance Check List.

$>$ Ensure that temperature and humidity around the inverters is as required in the instruction manual, installed away from any sources of heat and the correct ventilation is provided..
$>$ For replacement of a failed or damaged inverter consult with the local supplier.
$>$ Ensure that the installation area is free from dust and any other contamination.
$>$ Check and ensure that the ground connections are secure and correct.
Terminal screws must be tight, especially on the power input and output of the inverter.
Do not perform any insulation test on the control circuit.

## 2. Insulation test Method .

## Single Phase

## Three Phase

## Chapter 11 Inverter Peripheral devices and Options

## 11．1 Braking Resistors and Braking Units

Inverters ratings 200V 1～30HP／400V 1～40HP（IP20）and 400V 1～25HP（IP55）have a built－in braking transistor．For applications requiring a greater braking torque an external braking resistor can be connected to terminals B1／P and B2 in protection level of IP20 and to terminals B1 and B2 in protection level of IP55；for inverter ratings above $200 \mathrm{~V} 40 \mathrm{HP} / 400 \mathrm{~V} 50 \mathrm{HP}$（IP20）or 400 V 30 HP （IP55）， external braking units（connected to $\oplus-\ominus$ of the inverter）and braking resistors（connected to two ends of the detection module B－P0）are required．

Table 11．1．1 List of braking resistors and braking units（IP20）

| Inverter |  |  | Braking unit |  | Braking resistor |  |  |  |  | Braking torque （Peak／ Continues） 10\％ED | Minimum <br> Resistance ${ }^{*}$ |  |

Note 1：Keep sufficient space between inverter，braking unit and braking resistor and ensure proper cooling is provided for．

### 11.2 AC Line Reactors

An AC line reactor can be used for any of the following:

- Capacity of power system is much larger than the inverter rating.
- Inverter mounted close to the power system (in $33 \mathrm{ft} / 10$ meters).
- Reduce harmonic contribution (improve power factor) back to the power line.
- Protect inverter input diode front-end by reducing short-circuit current.
- Minimize overvoltage trips due to voltage transients.

Please select the AC line reactor based on the inverter rating according to the following table.
Table11.2.1 List of AC Line Reactors

| Model |  | AC reactor |  |
| :---: | :---: | :---: | :---: |
| Voltage | HP | Inductance Value (mH) | Rated Current (A) |

|  | 375/425 | 0.04 | 720 |

| Model |  | AC reactor |  |
| :---: | :---: | :---: | :---: |
| Voltage | HP | Inductance Value <br> $(\mathbf{m H})$ | Rated Current (A) |
|  | 535 | 0.02 | 862 |
|  | $\mathbf{6 7 0}$ | 0.02 | 1050 |
|  | $\mathbf{8 0 0}$ | 0.02 | 1200 |

Note: AC reactors listed in this table can only be used for the inverter input side. Do not connect AC reactor to the inverter output side. 200V class 60~175HP (IP20), 400V class 100HP~425HP (IP20 standard H \& C type), 400 V class $125 \mathrm{HP} \sim 425 \mathrm{HP}$ (IP20 enhanced E \& G type) and 5HP~100HP (IP55) have built-in DC reactors. If required by the application an AC reactor may be added.

### 11.3 Input Noise Filters

## A. Input Noise Filter on Specifications \& Ratings

Install a noise filter on power supply side to eliminate noise transmitted between the power line and the inverter. The inverter noise filter shown in Table 11.3.1 and Table 11.3.2 below meets the EN61800-3 class A specification. 400 V inverter class models can be ordered with integrated noise filter.

Table 11.3.1 Input Noise Filter Specifications and Ratings (IP20)

| Inverter size |  | Noise filter |  |
| :---: | :---: | :---: | :---: |
| Input voltage | HP | Model | Dimension |

## B. Input or Output Noise Filter (EMI Suppression Zero Phase Core)

- Part Number: 4H000D0250001
- Select a matched ferrite core to suppress EMI noise according to the required power rating and wire size.
- The ferrite core can attenuate high frequencies in the range of 100 kHz to 50 MHz , as shown in figure 11.4.1 below, and therefore should minimize the RFI generated by the inverter.
- The zero-sequence noise ferrite core can be installed either on the input side or on the output side. The wire around the core for each phase should be wound by following the same convention and in one direction. The more turns without resulting in saturation the better the attenuation. If the wire size is too large to be wound, all the wiring can be grouped and put through several cores together in one direction.

Figure 11.3.1 Frequency attenuation characteristics ( 10 windings case)

Figure 11.3.2 Example of EMI Suppression Zero Phase Core Application

Note: All the wiring of phases U/T1, V/T2, W/T3 must pass through the same zero-phase core without crossing over.

### 11.4 Input Current and Fuse Specifications

IP20 200V class

| Model | Horse power | KVA | $100 \%$ of rated output current | Rated input current (3申) | $\begin{gathered} \text { Fuse rating } \\ (3 \phi) \\ \hline \end{gathered}$ | Rated input current (1 $\phi$ ) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| F510-2001- $\square$ | 1 | 1.9 | 5.0 | 5.4 | 20 | 9.4 |

| F510-4003-C3(F)N4 | 3 | 4.1 | 5.4 | 5.9 | 16 |
| F510-4005-C3(F)N4 | 5 | 7.0 | 9.2 | 9.6 | 20 |
| F510-4008-C3(F)N4 | 7.5 | 8.5 | 12.1 | 11.6 | 20 |
| F510-4010-C3(F)N4 | 10 | 13.3 | 17.5 | 18.2 | 30 |
| F510-4015-C3(F)N4 | 15 | 18 | 23 | 24 | 40 |
| F510-4020-C3(F)N4 | 20 | 24 | 31 | 34 | 50 |
| F510-4025-C3(F)N4 | 25 | 29 | 38 | 41 | 70 |
| F510-4030-C3(F)N4 | 30 | 34 | 44 | 48 | 80 |
| F510-4040-C3(F)N4 | 40 | 41 | 54 | 59 | 100 |
| F510-4050-C3(F)N4 | 50 | 55 | 72 | 68 | 125 |
| F510-4060-C3(F)N4 | 60 | 67 | 88 | 96 | 150 |
| F510-4075-C3N4 | 75 | 79 | 103 | 112 | 200 |
| F510-4100-C3N4 | 100 | 111 | 145 | 140 | 250 |

Fuse type: Choose semiconductor fuse to comply with UL.

## Voltage Range:

For 200 V class inverter, use 300 V class fuse.
For 400 V class inverter, use 500 V class fuse.

### 11.5 Other options

## A. JN5-OP-F02 (LCD keypad)

LED keypad is standard for F510 IP20 model and it is optional for LCD keypad. Refer to the following figure.

## B. Blank operation box and digital operator wire

- Digital operator can detach inverter itself and users apply digital operator wire for remote operation. Wires have four specifications, inclusive of $1 \mathrm{~m}, 2 \mathrm{~m}, 3 \mathrm{~m}$, and 5 m .
- For digital operation remote control, separately blank operation box installed in the original position of the operator to prevent the entry of foreign matter.

Remote control installation diagram
blank operation box

| Name | Model | specification |
| :---: | :---: | :---: |
| blank <br> operation <br> box | JN5-OP-A03 | Black Panel |

| Name | Model | specification |
| :---: | :---: | :---: |
| LED digital <br> operator <br> wire | JN5-CB-01M | $\mathbf{1 m}$ |
|  | JN5-CB-02M | $\mathbf{2 m}$ |
|  | JN5-CB-03M | $\mathbf{3 m}$ |
|  | JN5-CB-05M | $\mathbf{5 m}$ |

| Name | Model | specification |
| :---: | :---: | :---: |

|  | JN5-CB-02MK | $\mathbf{2 m}$ |
|  | JN5-CB-03MK | $\mathbf{3 m}$ |
|  | JN5-CB-05MK | $\mathbf{5 m}$ |

Dimensions of LED/LCD keypad (IP20):

Figure 11.5.2 Dimensions of LED keypad

Dimensions of LCD keypad (IP55):

Figure 11.5.3 Dimensions of LCD keypad (IP55)

## C. $\mathbf{1}$ to $\mathbf{8}$ Pump Card

Refer to instruction manual of the option card to install. JN5-IO-8DO Card: 8 Relay Output Card.

Terminals of JN5-IO-8DO:

| Terminal | Description |
| :---: | :---: |
| RY1~RY8 | Relay1~Relay8 A terminal output |
| CM1~CM4 | Common terminal output |

Wiring of JN5-IO-8DO (Example):

## D. Copy Unit (JN5-CU)

The copy unit is used to copy an inverter parameter setup to another inverter.

## E. RJ45 to USB connecting Cable (1.8m)

JN5-CM-USB has the function of converting USB communication format to RS485 to achieve the inverter communication control being similar with PC or other control equipment with USB port.

- Connecting:

### 11.6 Communication Options

(a) PROFIBUS communication interface module (JN5-CM-PDP)

For wiring example and communication setup refer to JN5-CM-PDP communication option manual.
(b) DEVICENET communication interface module (JN5-CM-DNET)

For wiring example and communication setup refer to JN5-CM-DNET communication option manual.
(c) CANopen communication interface module (JN5-CM-CAN)

For wiring example and communication setup refer to JN5-CM-CAN communication option manual.
(d) TCP-IP communication interface module (JN5-CM-TCPIP)

For wiring example and communication setup refer to JN5-CM-TCPIP communication option manual.

### 11.7 Others Options

## A. Protective Cover

If inverter is around the environment of dust or metal shavings, it is recommended to purchase the protective covers positioned on both sides of the inverter to prevent unknown objects from invading.

| Frame | Model |
| :---: | :---: |
| 1 | JN5-CR-A01 |
| 2 | JN5-CR-A02 |
| 4 | JN5-CR-A04 |

## B. High-speed communication expansion card \& I/O expansion card \& DC24V power card \& Middle layer case

If frame 1~4 of the enhanced inverter need to install 1 to 8 pump card, high-speed communication expansion card or I/O expansion card, middle layer case is necessary, which is option, to install between the top cover and the bottom case, for adding extra space to install the expansion card. For frame 2~4 of enhanced inverter, if only install 1 to 8 pump card, middle layer case is not necessary to use.

Table 1. Expansion card model number

| Expansion card type | Model number | Reference chapter |
| :---: | :---: | :---: |
| PROFIBUS high-speed comm. | JN5-CMHI-PDP | 11.9 |
| CANopen high-speed comm. | JN5-CMHI-CAN | 11.10 |
| EtherCAT high-speed comm. | JN5-CMHI-ECAT | 11.11 |
| I/O expansion | JN5-IO-2DO1AI | 11.12 |
| DC24V power card | JN5-PS-DC24V | 11.15 |

Table 2. Middle layer case model number

| Frame | Middle layer case model number |
| :---: | :---: |

| 3 | JN5-MD-A03 |
| 4 | JN5-MD-A04 |

Middle layer case outline

Middle layer case installation diagram

### 11.8 NEMA1 Kit

If NEMA1 or IP20 protective level is necessary to upgrade, it is recommended to purchase the NEMA1 kit positioned on top and bottom sides of the inverter. The drawings installed in the inverter, please refer to chapter 3.7.

| Frame | Model |
| :---: | :---: |
| 6 | JN5-NK-A06 |
| 7 | JN5-NK-A07 |
| 8 | JN5-NK-A08 |
| 9 | JN5-NK-A09 |

### 11.9 PROFIBUS high speed communication expansion card

### 11.9.1 Communication hardware and data structure

This product is the PROFIBUS high-speed communication expansion module; it can perform remote setting and communication functions through the PROFIBUS bus. It is used on the TECO A510s/F510 AC motor driver (hereinafter referred to as the "driver"), and allows the driver to operate on the PROFIBUS network.

### 11.9.2 Product specifications

PROFIBUS ports

| Item | Specifications |
| :---: | :--- |
| Connector | DB-9 |
| Transmission <br> rate | $9.6 \mathrm{Kbit} /$ s to 12Mbit/s (automatic detection of transmission rate) |
| Network <br> protocols | PROFIBUS communication protocol |

## AC motor driver port

| Item | Specifications |
| :---: | :--- |
| Connector | Communication card CN5 connector |
| Transmission <br> method | SPI high speed communication |
| Terminal <br> functions | 1. The communication module communicates with the AC motor <br> driver through this interface. <br> 2. The AC motor driver provides power to the communication <br> module through this interface. |
| Communication <br> protocols | TECO communication protocol |

### 11.9.3 Installation instructions

## PROFIBUS network connection

Definitions of PROFIBUS DP communication port pins are as shown in the figure below.

| $\begin{array}{ll} { }^{9} 0 & 0^{5} \\ 8^{8} & 0^{4} \\ 0 & 0^{3} \\ 0 & 0^{2} \\ { }^{7} 0 & 0^{2} \end{array}$ |  | Pin | Definition | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1~2 | Not assigned | - |
|  |  | 3 | RXD/TXD-P (B- <br> Line) | Receive/Send data -P |
|  |  | 4 | Not assigned | - |
|  |  | 5 | DGND (2M) | Data reference potential |
|  |  | 6~7 | Not assigned | - |
|  |  | 8 | RXD/TXD-N <br> (A-Line) | Receive/Send data -N |
|  |  | 9 | Not assigned | - |

## PROFIBUS network connection

As shown in the figure below, ID addresses (1~125) correspond to SW1 b1~b7.

| Function | DIP switch <br> position | DIP switch <br> status | Description |
| :---: | :---: | :---: | :---: |
| Network <br> address <br> setting | b1~b7 | 1000000 | Network <br> address is 1 |
|  |  | 1100000 | Network <br> address is 2 <br> address is 3 |
|  |  | $\ldots \ldots . . . .$. | $\ldots \ldots .$. |
|  |  | 1011111 | Network <br> address is 125 |
| No function | b8 | - | - |

Network address switch setting range: 1~125 (0, 128~255 cannot be used).

PROFIBUS bus terminal resistor

| Serial transmission <br> rate (kbps) | Maximum bus length <br> $(\mathrm{m})$ |
| :---: | :---: |
| 9.6 | 1200 |
| 19.2 | 1200 |
| 45.45 | 1200 |
| 93.75 | 1200 |
| 187.5 | 1000 |
| 500 | 400 |
| 1500 | 200 |
| 3000 | 100 |
| 6000 | 100 |
| 12000 | 100 |

### 11.9.4 LED indicator descriptions

The module has two dual-color LED indicators built-in used to quickly diagnose and monitor the communication statuses between the module itself and the bus.

## Module status LED (RUN LED \& ERR LED)

Used to monitor whether the equipment is operating normally.
$\left.\begin{array}{|c|c|}\hline \begin{array}{c}\text { Indicator } \\ \text { statuses }\end{array} & \text { Description } \\ \hline \begin{array}{c}\text { Does not light } \\ \text { up }\end{array} & \text { Power not supplied } \\ \hline \begin{array}{c}\text { Orange light } \\ \text { lights up }\end{array} & \begin{array}{c}\text { Communication with the } \\ \text { frequency converter not } \\ \text { established }\end{array} \\ \hline \begin{array}{c}\text { Red light flashes } \\ (1 \mathrm{~Hz})\end{array} & \begin{array}{c}\text { Communication error } \\ \text { with the frequency } \\ \text { converter }\end{array} \\ \hline \text { Red light flashes } \\ (4 \mathrm{~Hz})\end{array} \begin{array}{c}\text { Flip-switch ID address } \\ \text { error }\end{array}_{\text {Green light }}^{\text {flashes (4 Hz) }} \begin{array}{c}\text { Power supply normal } \\ \text { but DP communication } \\ \text { not established }\end{array}\right]$

## Network status LED (COMM LED)

Used to monitor the operability of the communication module PROFIBUS network.

| Indicator <br> statuses | Description |
| :---: | :---: |
| Does not light <br> up | DP communication <br> not established |
| Green light <br> lights up | DP communication <br> established and <br> normal |

### 11.9.5 Driver parameter setting descriptions

Used to monitor the operability of the communication module PROFIBUS network.
Users must first confirm related parameter settings on the driver in order to ensure that the communication module can connect normally.

| Parameters | Parameter name | Settings | Settings descriptions |
| :---: | :---: | :---: | :---: |
| $00-02$ | Operation command source | 2 | Communication control |
| $00-05$ | Frequency command source | 3 | Communication control |

### 11.9.6 Connection instructions

 PPO communication| PKW |  |  |  | PZD |  |  |  |  |  |  |  |  |  |

| PPO4 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| PPO5 |  |  |  |  |  |  |  |  |  |  |  |  |  |

| PKW: Parameter address/value | STW: Control character |
| :--- | :--- |
| PZD: Process data | ZSW: Status character |
| PKE: Parameter address | HSW: Main settings |
| IND: Subindex | HIW: Main actual value |
| PWE: Parameter value |  |

## PZD Structure default

User parameters of the communication module configured through the GSD file. Default values of the PZD structure are as follows:
STW1 Control character; mapped to the MODBUS address $0 \times 2501$ of the driver. HSW Main setting value; mapped to the MODBUS address $0 \times 2502$ of the driver. ZSW1 Status character; mapped to the MODBUS address $0 \times 2520$ of the driver. HIW Main actual value; mapped to the MODBUS address $0 \times 2524$ of the driver.

PLC Master station $\rightarrow$ driver slave station

Driver slave station $\rightarrow$ PLC master station
Driver output status; mapped to the MODBUS addresses $0 \times 2520 \sim 0 \times 252 \mathrm{~F}$ of the driver. The default values of PZD3/PZD4/PZD5/PZD6 are set as follows:
PZD3: Default multi-function terminal block on/off status; mapped to the MODBUS address $0 \times 2522$ of the driver.

PZD4: Default output current; mapped to the MODBUS address $0 \times 2527$ of the driver.
PZD5: Default output current; mapped to the MODBUS address $0 \times 2521$ of the driver.
PZD6: Default output current; mapped to the MODBUS address $0 \times 2528$ of the driver.

### 11.9.7 Meanings of each character

## Control character STW

| Bit | Description | 1 | 0 |
| :---: | :--- | :---: | :---: |
| 0 | Operation command | Operate | Stop |
| 1 | Reverse command | Reverse | Forward |
| 2 | External error | Error | - |
| 3 | Error reset | Reset | - |
| $4 \sim 5$ | Reserved | - | - |
| 6 | Multi-function terminal S1 | ON | OFF |
| 7 | Multi-function terminal S2 | ON | OFF |
| 8 | Multi-function terminal S3 | ON | OFF |
| 9 | Multi-function terminal S4 | ON | OFF |
| A | Multi-function terminal S5 | ON | OFF |
| B | Multi-function terminal S6 | ON | OFF |
| C | Multi-function terminal S7 | ON | OFF |
| D | Multi-function terminal S8 | ON | OFF |
| E | Controller mode | ON | OFF |
| F | Communication setting torque <br> command | ON |  |

## Status character ZSW

| Bit | Meaning | 1 | 0 |
| :---: | :--- | :---: | :---: |
| 0 | Operation status | Operate | Stop |
| 1 | Direction status | Reverse | Forward |
| 2 | Frequency converter operation <br> preparation status | Preparation <br> complete | Not yet <br> prepared |
| 3 | Error | Abnormal | Normal |
| 4 | Warning | ON | OFF |
| 5 | Zero speed | ON | OFF |

| 6 | Model 440 | ON | OFF |
| :---: | :--- | :---: | :---: |
| 7 | Frequency reached | ON | OFF |
| 8 | Any frequency reached | ON | OFF |
| 9 | Frequency detection one | ON | OFF |
| A | Frequency detection two | ON | OFF |
| B | Low voltage | ON | OFF |
| C | Frequency converter no output | ON | OFF |
| D | Frequency not according to <br> communication | ON | OFF |
| E | SeqNotFromComm | ON | OFF |
| F | Over-torque | ON | OFF |

### 11.9.8 PKW regional access parameters

The driver can provide request and response information. Due to the request and response mechanism, the master station must send requests until a communication response is received. The 4 characters of the PKW region are as follows:

## Parameters address PKE

Bit 0~11 (PNU): Parameter address/MODBUS address that includes related parameters. Parameter address/MODBUS address: Please refer to the MODBUS communication protocol description chapter in the driver manual for the register numbers, registers and data format that corresponds to the operation parameters.

Bit 12~15 (AK): Includes the identification characters of requests or responses.

## Request character AK

PLC master station $\rightarrow$ driver slave station

| Request Identifier | Description |
| :---: | :--- |
| 0 | No request |
| 1 | Read parameter value |
| 2 | Modify parameter value |

## Response character AK

Driver slave station $\rightarrow$ PLC master station

| Request Identifier | Description |
| :---: | :--- |
| 0 | No response |
| 1 | Request parameter value processed |
| 7 | Request parameter value cannot process |

## Error character

If the request parameter value was not processed, then the error codes that will be kept in the low-bit PWE1 set are as follows:

| Error <br> code | Description |
| :---: | :--- |
| 0 | Parameter does not exist |
| 1 | The current status parameter cannot be <br> read/written |
| 2 | Parameter value not within range |
| 101 | Other SP communication error occurred, such as: <br> response timeout |

## Parameter Value PWE

Driver parameters are sent through PWE2 (4th word). In the following example, PWEI (3rd word) must be set as 0 in the PROFIBUS master station.

## Example of the PKW mechanism:

For example: Read parameters 00-05 (frequency command source).
Read the values of 00-05; first set the request identification character as 1 , and then refer to the MODBUS communication protocol description chapter in the driver manual to find out that the address of $00-05$ is $0 \times 0005$, then the data sequences are as follows:

PLC master station $\rightarrow$ driver slave station: 1000000500000000 Driver slave station $\rightarrow$ PLC master station: 1000000500000004

| Request |  |
| :--- | :---: |
| 1st word <br> (PKE) | 1000 |
| 2nd word <br> (IND) | 0005 |
| 3rd word <br> (PWE1) | 0000 |
| 4th word <br> (PWE2) | 0000 |

| Response |  |
| :--- | :---: |
| 1st word (PKE) | 1000 |
| 2nd word (IND) | 0005 |
| 3rd word (PWE1) | 0000 |
| 4th word (PWE2) | 0004 |

### 11.9.9 Troubleshooting

There are two indicators on top of the PROFIBUS communication module; when malfunction occurs, the cause of the malfunction can be confirmed based on the indicator statuses, and troubleshoot the error by following the descriptions below.

Indicator troubleshooting

## Module status LED

| Indicator <br> statuses | Status name | Troubleshooting method |
| :---: | :---: | :--- |
| Does not light <br> up | Power not <br> supplied to <br> the <br> communicat <br> ion module | 1. Confirm whether the driver power is normal. <br> 2. Confirm whether the power terminal of the <br> communication module is connected to the driver. |
| Red and green <br> light flashes <br> alternately | Self-check | 1. The host is under self-check; if it flashes <br> continuously, disconnect the power and then reconnect <br> it. <br> 2. Confirm whether the driver communication <br> connection parameters are properly set (19200, 8, N, 1) |
| Green light | the <br> communicat <br> ion module <br> standby | 1. Not yet connected with the driver. |

## Network status LED

| Indicator <br> statuses | Status name | Description |
| :--- | :--- | :--- |

| Does not light <br> up | Power not <br> supplied | 1. Confirm whether the driver power is normal. <br> 2. Confirm whether the power terminal of the <br> communication module is connected to the driver. |
| :---: | :---: | :--- |
|  | Standby | 1. Not yet connected with the PROFIBUS host terminal. |

### 11.9.10 GSD File

When using the Profibus communication module, if the GSD description file (JN5-CMHI-PDP_V (latest version).GSD) is needed, please download it from the TECO official website or request for it from your purchasing sales channel.

### 11.10 CANopen high speed communication expansion card

### 11.10.1 Communication hardware and data structure

This product is the CANopen high-speed communication expansion module; it can perform remote setting and communication functions through the CANopen bus. It can only be used with the TECO A510s/F510 AC motor driver (hereinafter referred to as the "driver"), and allow the driver to operate on the CANopen network.

### 11.10.2 Product specifications

CANopen ports

| Item | Specifications |
| :---: | :--- |
| Connector | 5-pin open pluggable connector; pin spacing 5.08mm |
| Transmission | $10 \mathrm{kbps}, 20 \mathrm{kbps}, 50 \mathrm{kbps}, 125 \mathrm{kbps}, 250 \mathrm{kbps}, 500 \mathrm{kbps}, 800 \mathrm{kbps}$, |
| rate | 1 Mbps |
| Network <br> protocols | CANopen communication protocol |

## AC motor driver port

| Item | Specifications |
| :---: | :--- |
| Connector | Communication card CN5 connector |
| Transmission <br> method | SPI high speed communication |
| Terminal | 1. The communication module communicates with the AC motor <br> driver through this interface. |
| functions | 2. The AC motor driver provides power to the communication <br> module through this interface. |
| Communication <br> protocols | TECO communication protocol |

### 11.10.3 Installation instructions

## Communication module contact description

As shown in the figure below, A - Terminal block (TB1)
$\mathrm{B}, \mathrm{C}$ - Mounting holes
D - RUN LED
E - ERR LED
F - Control board connector (CN5)
G - Rate setting switch
H - ID address setting switch

## Terminal block definition

As shown in the figure below, the contact definitions in the order from left to right are GND, CAN_L, NC, CAN_H and NC.

## ID address setting description

As shown in the figure below, ID addresses (1~127) correspond to SW1 b1~b7.

Transmission rate corresponds to SW2 b1~b3.

| Function | DIP switch <br> position | DIP switch <br> status <br> 7654321 | Description |
| :---: | :---: | :---: | :---: |

Network address switch setting range: 1~127 ( $0,128 \sim 255$ cannot be used).
Transmission rate switch setting range: $0 \sim 7$ ( $8 \sim 15$ cannot be used).

### 11.10.4 Transmission rate, maximum transmission distance and cable

 lengthThe maximum allowable length of the bus bar mainly depends on the type of cable used. The allowed cable types are:

- Thin cable
- Thick cable
- Flat cable

ODVA requirements for data transmission cable (Thick cable):

| Serial <br> transmission rate <br> $($ kbps ) | Maximum bus <br> length (m) | Serial <br> transmission rate <br> (kbps) | Maximum bus <br> length (m) |
| :--- | :--- | :--- | :--- |
| 1000 | 25 | 125 | 500 |
| 800 | 50 | 50 | 1000 |
| 500 | 100 | 20 | 2500 |
| 250 | 250 | 10 | 5000 |

### 11.10.5 LED indicator descriptions

The module has RUN (green) and ERR (red) indicators built-in used to quickly diagnose and monitor the communication statuses between the module itself and the bus.

## Module status LED (RUN LED)

Used to monitor whether the equipment is operating normally.

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :---: |
| Does not light <br> up | Initial status | Power not supplied |
| Continuous <br> flashing | Pre-operation | Preparation status |
| Single flash | Stop | Stopping |
| Green light <br> lights up | Operation | Operating |

## Error status LED (ERR LED)

Used to monitor the operability of the communication module CANopen network.

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :---: |
| Does not light <br> up | No error | Operating |

| Single flash | Warning | Packet error |
| :---: | :---: | :---: |
| Double flash | Error | Guard/Heartbeat error |
| Red light lights <br> up | Disconnected | Bus closed |

### 11.10.6 Driver parameter setting descriptions

Used to monitor the operability of the communication module CANopen network.
Users must first confirm related parameter settings on the driver in order to ensure that the communication module can connect normally.

| Parameters | Parameter name | Settings | Settings descriptions |
| :---: | :---: | :---: | :---: |
| $00-02$ | Operation command source | 2 | Communication control |
| $00-05$ | Frequency command source | 3 | Communication control |

### 11.10.7 Connection instructions

## Service data object (SDO)

This module supports 1 SDO server, which means it can provide SDO service, and the SDO uses the sending and receiving COB-ID of the predefined connection, $0 \times 580+$ NodeID (sending) and 0x600 + NodeID (receiving).
Each SDO message includes a set of COB-ID (request SDO and response SDO); it allows performing of access actions within two nodes. SDO can transmit any size of data, but segment transmission must be used once it exceeds 4 bytes.

The COB IDs of SDO communication are as follows:
Read: Master to slave (request code 0x40) / Master to slave: $600 \mathrm{H}+$ Node ID

| COB-ID | Byte0 | Byte1 | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} (600 \mathrm{H})+\text { Node } \\ \text { ID } \end{gathered}$ | Reque st code | Object index |  | Object subind ex |  | Reque | data |  |
|  |  | LSB | MSB |  |  | Res | ved |  |

Read: Slave response / slave to master: 580H + Node ID

| COB-ID | Byte0 | Byte1 | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Reque | Object index |  | Object <br> subind <br> ex | Request data |  |  |  |
| ID | st code | LSB | MSB |  | $\begin{gathered} \text { bit0~ } \\ \text { bit7 } \end{gathered}$ | Bit8~ <br> bit15 | Bit16~ bit23 | Bit24~ <br> bit31 |

Response code:
43H: Read 4-byte data / 4BH: read 2-byte data / 4FH: read 1-byte data

Write: Master to slave (4-byte data maximum)

| COB-ID | Byte0 | Byte1 | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(600 H)+$ Node <br> ID | Reque <br> st | Object index |  | Object | Request data |  |  |  |
|  | code | LSB | MSB | subind <br> ex | bit0~ <br> bit7 | Bit8~ <br> bit15 | Bit16~ <br> bit23 | Bit24~ <br> bit31 |

Request code:
23H: Write a 4-byte data entry
2BH: Write a 2-byte data entry
2FH: Write a 1-byte data entry

Write: Slave to master (response code 0x60H)

| COB-ID | Byte0 | Byte1 | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(580 \mathrm{H})+$ Node | Reque | Object index |  | Object subind ex | Request data |  |  |  |
| ID | st code | LSB | MSB |  | Reserved |  |  |  |

When we use SDO to perform control to the group 25 H of the driver control group, corresponding rules are as follows:

| Index |
| :---: |
| $25 \times x H$ (register |
| address) |

For example, when we want to perform write/read to 2501 H of the control group, the corresponding SDO object index is the control group register address 2501 H .
Perform operation with index 2501H directly and the module will automatically convert to the A510s 2501 H control group register address to perform operation.

### 11.10.8 Object index list

Basic index

| Index | Sub | Name | Default value | R/W | Size | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1000H | 0 | Device type | 00010192H | R | U32 |  |

### 11.10.9 Troubleshooting

There are two indicators on top of the CANopen communication module; when malfunction occurs, the cause of the malfunction can be confirmed based on the indicator statuses, and troubleshoot the error by following the descriptions below.

Indicator troubleshooting
Module status LED (RUN LED)

| Indicator <br> statuses | Status name | Troubleshooting method |
| :---: | :--- | :--- |
| Does not <br> light up | Power not supplied to <br> the communication <br> module | 1. Confirm whether the driver power is normal. <br> 2. Confirm whether the power terminal of the <br> communication module is connected to the <br> driver. |

Error status LED (ERR LED)

| Indicator <br> statuses | Status name | Description |
| :---: | :--- | :--- |
| Single | CANopen packet error | Poor connection quality with the CANopen host <br> terminal or host not connected when powered <br> on. Continue transmission or power off <br> inspection can be selected. Two results can be <br> expected with continue transmission 1) Packet <br> transmission returns to normal and the red light <br> no longer flashes 2) Packet continues to have <br> errors causing disconnection. When the power is <br> off, check whether the TB1 terminal and cable <br> are firmly connected, and whether the <br> transmission rate, maximum transmission <br> distance and cable length comply with ODVA <br> specifications. |
| Double | Guard/Heartbeat error | User sends periodic heartbeat messages. If a <br> flash <br> message is not received after a specific time, <br> please disconnect the power and check the <br> connection status of that node. |
| Red light |  |  |
| lights up | Disconnected | Cannot connect with the CANopen host <br> terminal; disconnect the power and check <br> whether the TB1 terminal and cable is firmly <br> connected, and whether the transmission rate, <br> maximum transmission distance and cable |
| length comply with ODVA specifications. |  |  |

### 11.10.10 EDS file

When using the CANopen communication module, if the EDS description file (JN5-CMHI-CAN_V (latest version).eds) is needed, please download it from the TECO official website or request for it from your purchasing sales channel.

### 11.11 Introduction to the EtherCAT high speed communication

## expansion module

### 11.11.1 Communication hardware and data structure

This product is the EtherCAT high-speed communication expansion module (hereinafter referred to as communication module); it can perform remote setting and communication functions through the EtherCAT network environment. It can only be used with the TECO A510s/F510 AC motor driver (hereinafter referred to as a driver), and allow the driver to operate on the EtherCAT network.

### 11.11.2 Product specifications

## EtherCAT ports

| Item | Specifications |
| :---: | :--- |
| Connector | Dual-port network socket |
| Network <br> protocols | EtherCAT communication protocol |

## AC motor driver port

| Item | Specifications |
| :---: | :--- |
| Connector | Communication card CN5 connector |
| Terminal | 1. The communication module communicates with the AC motor <br> driver through this interface. |
| functions | 2. The AC motor driver provides power to the communication <br> module through this interface. |

### 11.11.3 Installation instructions

## Communication module contact description

As shown in the figure below, the framed part is the CN5 connector that connects to the driver.

## Communication module network socket

As shown in the figure below, the left socket is input and the right socket is output.

## Driver parameter setting description

Users must first confirm related parameter settings on the driver in order to ensure that the communication module can connect normally.

| Parameters | Parameter name | Settings | Settings descriptions |
| :---: | :---: | :---: | :---: |
| $00-02$ | Operation command source | 2 | Communication control |
| $00-05$ | Frequency command source | 3 | Communication control |

### 11.11.4 LED indicator descriptions

The module has two dual-color LED indicators built-in used to quickly diagnose and monitor the communication statuses between the module itself and the EtherCAT network.

## Module status LED2

Used to monitor whether the communication module is operating normally.

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :--- |
| Does not <br> light up | Power not supplied | Power not supplied |
| Red light <br> flashes | Data transmitting | Driver and communication <br> expansion module data transmitting |
| Red/green <br> light lights <br> up | Driver data <br> transmission error | Data transmission error between the <br> driver and communication expansion <br> module |

## Network status LED1

Used to monitor the operability of the communication module EtherCAT network.

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :---: |
| Does not <br> light up | Not connected / <br> INIT | EtherCAT network not connected <br> (INIT) |
| Green light <br> flashes | Standby | Preparation status (Pre-OP) |
| Green light <br> lights up | Operation status | Operation status (OP) |
| Red light <br> lights up | Driver data <br> transmission error | Data transmission error between the <br> driver and communication expansion <br> module |

### 11.11.5 Object index list

Basic index

| Index | Sub- <br> Index | Name | Default value | R/W | Size | Remarks |

### 11.11.6 Troubleshooting

There are two indicators on top of the EtherCAT communication module. When a malfunction occurs, the cause of the malfunction can be confirmed based on the indicator statuses, and troubleshoot the error by following the descriptions below.

Indicator troubleshooting

## Module status LED2

| Indicator <br> statuses | Status name | Troubleshooting method |
| :---: | :---: | :--- |
| Does not <br> light up | Power not supplied | 1. Confirm whether the driver power is normal. <br> 2. Confirm whether the power terminal of the <br> communication module is connected to the <br> driver. |
| Red/green <br> light lights <br> up | Driver data <br> transmission error | 1. Confirm whether the communication module <br> has proper contact. <br> 2. Reconnect the power of the driver and <br> confirm whether the error has been eliminated. |

## Network status LED1

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :--- |
| Does not <br> light up | Not connected / INIT | 1. Confirm whether the driver power is normal. <br> 2. If connected to EtherCAT, confirm whether it is <br> in INIT mode. |
| Red light <br> lights up | Driver data <br> transmission error | 1. Confirm whether the communication module <br> has proper contact. <br> 2. Reconnect the power of the driver and confirm <br> whether the error has been eliminated. |

### 11.11.7 xml file

When using the EtherCAT communication module, if the xml description file (JN5-CMHI-ECAT_V (latest version).xml) is needed, please download it from the TECO official website or request for it from your purchasing sales channel.

### 11.12 I/O expansion card

### 11.12.1 Hardware and data structure

This product is an I/O expansion module; it allows performing of I/O expansion functions through the SPI bus. Used with the TECO A510s/F510 AC motor driver (hereinafter referred to as a driver).

### 11.12.2 Product specifications

I/O ports

| Item | Specifications |  |
| :---: | :---: | :---: |
| Connector | TB1 $\quad 7$ external contacts |  |

## AC motor driver port

| Item | Specifications |
| :---: | :--- |
| Connector | Control board CN5 connector |
| Transmission <br> method | SPI high speed communication |
| Terminal <br> functions | TB1 $\quad 7$ external contacts, applicable wire diameter: AWG <br> $20 \sim 14$ stranded wire |

### 11.12.3 Installation instructions

## Contact description

| Type | Terminal | Terminal functions | Signal level |
| :---: | :---: | :---: | :---: |
| Analog input signal | AI3 | Main speed command input; SW7 can be used to switch between voltage or current input $(-10 \sim 10 \mathrm{~V}) /(4-20 \mathrm{~mA})$ | -10 V to +10 V , <br> (Input resistance $500 \mathrm{~K} \Omega$ ) <br> 4 to 20 mA <br> (Input resistance: 500 $)$ <br> (12bit resolution) |
|  | GND | Analog signal shared terminal | --- |
| Relay Output | R4A- <br> R4B- <br> R4C | Relay A contact (multi-function output terminal) Relay B contact (multi-function output terminal) Relay shared terminal; please refer to the manual for its functions. | Terminal capacity: <br> At $250 \mathrm{Vac}, 10 \mathrm{~mA} \sim 1 \mathrm{~A}$ <br> At 30Vdc, $10 \mathrm{~mA} \sim 1 \mathrm{~A}$ |
| Digital <br> Output | DO2 | Multi-function (open collector transistor) output: Operating, zero speed, frequency consistent, any frequency consistent, output frequency, preparation complete, low-voltage detection, output occlusion, operation and frequency commands, over-torque detection, abnormal, low-voltage, overheat, motor over-load, frequency converter over-load output, retrying, signal abnormal, chronograph output... | $48 \mathrm{Vdc}, 2 \mathrm{~mA} \sim 50 \mathrm{~mA}$ <br> Optical coupling output |
|  | DOG | Open collector transistor shared terminal |  |

### 11.12.4 Driver parameter setting descriptions

Please refer to group 3, 4 parameter descriptions in the manual

### 11.13 DC reactor

Installing a DC reactor at the DC terminal of the frequency converter provides the following advantages:

- Improves the input current waveform distortion caused by the rectifier in the frequency converter while maintaining continuous rectified current.
- Suppresses instantaneous current surges and prevents related overheating phenomenon caused by the rectifier and voltage regulator components due to instantaneous current surges.
- Reduces harmonic interference problems generated by the frequency converter.
- Improves and increase power factor and reduces AC component pulses at the DC terminal.
- Compared to AC reactors, the size of DC reactors are smaller and the costs are also lower.

Table 6.13 DC reactor list

| Model |  |  | DC reactor |  |
| :---: | :---: | :---: | :---: | :---: |
| V | HP | Rated current (A) | Inductance value $(\mathrm{mH})$ | Rated current (A) |

|  | 3 | 5.4 | 4.2 | 11 |
|  | 5 | 9.2 | 2.8 | 20 |

| Model |  |  | DC reactor |  |
| :---: | :---: | :---: | :---: | :---: |
| v | HP | Rated current <br> (A) | Inductance value (mH) | Rated current (A) |
|  | 7.5 | 12.1 | 2.8 | 20 |
|  | 10 | 17.5 | 2.1 | 30 |
|  | 15 | 23 | 1.4 | 35 |
|  | 20 | 31 | 1.0 | 50 |
|  | 25 | 38 | 0.83 | 60 |
|  | 30 | 44 | 0.7 | 70 |
|  | 40 | 58 | 0.51 | 90 |
|  | 50 | 73 | 0.41 | 115 |
|  | 60 | 88 | 0.34 | 140 |
|  | 75 | 103 | 0.28 | 160 |
|  | 100 | 145 | 0.2 | 230 |
|  | 125 (built-in) | 168 | 0.18 | 240 |
|  | 150 (built-in) | 208 | 0.15 | 240 |
|  | 175 (built-in) | 250 | 0.22 | 290 |
|  | 215 (built-in) | 296 | 0.15 | 370 |
|  | 270 (built-in) | 328 | 0.15 | 370 |
|  | 300 (built-in) | 435 | 0.12 | 520 |
|  | 375 (built-in) | 515 | 0.08 | 800 |
|  | 425 (built-in) | 585 | 0.08 | 800 |
|  | 535 | 700 | 0.05 | 1000 |
|  | 670 | 875 | 0.04 | 1200 |
|  | 800 | 960 | 0.03 | 1400 |

Note: When using DC reactors, please first remove the short-circuit copper sheet between the P1 and P2 terminals, and then fix the current reactor on these two terminals.

### 11.14 Sinusoidal output reactor

The parasitic inductance and capacitance that exist in the frequency converter and motor wiring are determined by the component switching speed and wiring of the frequency converter. The voltage of the motor terminal will reach as high as twice the DC voltage of the frequency converter. LC resonance may cause surge voltages at the motor terminal and cause danger. Installing an AC reactor at the frequency converter output can suppress voltages (dv/dt). If the wiring length is too long, suppression of surge voltages will become more difficult. Installing a sinusoidal output filter at the output terminal of the frequency converter can prevent the motor terminal voltage from generating surges.

Table 6.14 Sinusoidal output reactor list

| Model |  |  | Output reactor |  |
| :---: | :---: | :---: | :---: | :---: |
| V | HP | Rated current (A) HD/ND | Inductance value ( mH ) | Rated current (A) |

|  | 3 | 5.4 | 1.01 | 6.9 |
|  | 5.4 | 9.2 | 0.58 | 12.1 |
|  | 7.5 | 12.1 | 0.58 | 12.1 |
|  | 10 | 17.5 | 0.4 | 17.5 |
|  | 15 | 23 | 0.3 | 23 |

| Model |  |  | Output reactor |  |
| :---: | :---: | :---: | :---: | :---: |
| V | HP | Rated current (A) HD/ND | Inductance value ( mH ) | Rated current (A) |
|  | 20 | 31 | 0.23 | 31 |
|  | 25 | 38 | 0.18 | 38 |
|  | 30 | 44 | 0.16 | 44 |
|  | 40 | 58 | 0.12 | 58 |
|  | 50 | 73 | 0.1 | 73 |
|  | 60 | 88 | 0.08 | 88 |
|  | 75 | 103 | 0.07 | 103 |
|  | 100 | 145 | 0.05 | 145 |
|  | 125 | 168 | 0.04 | 168 |
|  | 150 | 208 | 0.032 | 208 |
|  | 175 | 250 | 0.027 | 250 |
|  | 215 | 296 | 0.023 | 296 |
|  | 270 | 328 | 0.021 | 328 |
|  | 300 | 435 | 0.015 | 435 |
|  | 375 | 515 | 0.012 | 515 |
|  | 425 | 585 | 0.012 | 585 |
|  | 535 | 700 | 0.01 | 700 |
|  | 670 | 875 | 0.08 | 875 |
|  | 800 | 960 | 0.07 | 960 |

Note: 1. The frequency converter has improved IGBT equipment and soft-switching driver circuit; compared to previous models, it can improve dv/dt by approximately $50 \%$ terminal voltage.
2. The purposes of installing sinusoidal output filters are as follows:

- Prolong motor life.
- Reduce motor interference.
- Reduce frequency converter pulse load.
- Improve system stability and efficiency.

### 11.15 DC24V power expansion card

This product allows parts of the communication or driver functions to operate normally before connecting power to the frequency converter.

### 11.15.1 JN5-PS-DC24V product specifications

## Connection terminal

| Item | Specifications |
| :---: | :--- |
| Input <br> terminal | $24 \mathrm{~V}: 24 \mathrm{~V} \pm 5 \%, 0.6 \mathrm{~A}$ <br> $0 \mathrm{~V}: 24 \mathrm{~V}$ reference ground |
| Notes | The terminals above cannot be connected to the power and terminals <br> on the frequency converter itself in order to achieve the goal of safety <br> isolation. |

## Appendix-A Instructions for UL

## Safety Precautions

| Electrical Shock Hazard |
| :--- |
| Do not connect or disconnect wiring while the power is on. |
| Failure to comply will result in death or serious injury. |

## WARNING <br> Electrical Shock Hazard

Do not operate equipment with covers removed.
Failure to comply could result in death or serious injury.
The diagrams in this section may show drives without covers or safety shields to show details. Be sure to reinstall covers or shields before operating the drives and run the drives according to the instructions described in this manual.

Always ground the motor-side grounding terminal.
Improper equipment grounding could result in death or serious injury by contacting the motor case.
Do not touch any terminals before the capacitors have fully discharged.
Failure to comply could result in death or serious injury.
Before wiring terminals, disconnect all power to the equipment. The internal capacitor remains charged even after the power supply is turned off. After shutting off the power, wait for at least the amount of time specified on the drive before touching any components.

Do not allow unqualified personnel to perform work on the drive.
Failure to comply could result in death or serious injury.
Installation, maintenance, inspection, and servicing must be performed only by authorized personnel familiar with installation, adjustment, and maintenance of AC drives.

Do not perform work on the drive while wearing loose clothing, jewelry, or lack of eye protection.
Failure to comply could result in death or serious injury.
Remove all metal objects such as watches and rings, secure loose clothing, and wear eye protection before beginning work on the drive.

Do not remove covers or touch circuit boards while the power is on.
Failure to comply could result in death or serious injury.

## Fire Hazard

Tighten all terminal screws to the specified tightening torque.
Loose electrical connections could result in death or serious injury by fire due to overheating of electrical connections.
Do not use an improper voltage source.
Failure to comply could result in death or serious injury by fire.
Verify that the rated voltage of the drive matches the voltage of the incoming power supply before applying power.
Do not use improper combustible materials.
Failure to comply could result in death or serious injury by fire.
Attach the drive to metal or other noncombustible material.

## NOTICE

Observe proper electrostatic discharge procedures (ESD) when handling the drive and circuit boards.
Failure to comply may result in ESD damage to the drive circuitry.
Never connect or disconnect the motor from the drive while the drive is outputting voltage.
Improper equipment sequencing could result in damage to the drive.
Do not use unshielded cable for control wiring.
Failure to comply may cause electrical interference resulting in poor system performance. Use shielded twisted-pair wires and ground the shield to the ground terminal of the drive.

## NOTICE

## Do not modify the drive circuitry.

Failure to comply could result in damage to the drive and will void warranty.
Teco is not responsible for any modification of the product made by the user. This product must not be modified.
Check all the wiring to ensure that all connections are correct after installing the drive and connecting any other devices.
Failure to comply could result in damage to the drive.

## UL Standards

The UL/cUL mark applies to products in the United States and Canada and it means that UL has performed product testing and evaluation and determined that their stringent standards for product safety have been met. For a product to receive UL certification, all components inside that product must also receive UL certification.

UL/cUL Mark

## UL Standards Compliance

This drive is tested in accordance with UL standard UL508C and complies with UL requirements. To ensure continued compliance when using this drive in combination with other equipment, meet the following conditions:

## - Installation Area

Do not install the drive to an area greater than pollution severity 2 (UL standard).

## - Main Circuit Terminal Wiring

UL approval requires crimp terminals when wiring the drive's main circuit terminals. Use crimping tools as specified by the crimp terminal manufacturer. Teco recommends crimp terminals made by NICHIFU for the insulation cap.
The table below matches drives models with crimp terminals and insulation caps. Orders can be placed with a Teco representative or directly with the Teco sales department.

| Drive ModelF510 | Wire Gauge mm ${ }^{\text {2 }}$, (AWG) |  |  |  |  |  | Terminal | Crimp Terminal | Tool | Insulation Cap |

## Motor Over temperature Protection

Motor over temperature protection shall be provided in the end use application.

## - Field Wiring Terminals

All input and output field wiring terminals not located within the motor circuit shall be marked to indicate the proper connections that are to be made to each terminal and indicate that copper conductors, rated $75^{\circ} \mathrm{C}$ are to be used.

## - Drive Short-Circuit Rating

This drive has undergone the UL short-circuit test, which certifies that during a short circuit in the power supply the current flow will not rise above value. Please see electrical ratings for maximum voltage and table below for current.

- The MCCB and breaker protection and fuse ratings (refer to the preceding table) shall be equal to or greater than the short-circuit tolerance of the power supply being used.
- Suitable for use on a circuit capable of delivering not more than ( A ) RMS symmetrical amperes for ( Hp ) Hp in 240 / 480 V class drives motor overload protection.

| Horse Power (Hp ) | Current (A) | Voltage (V) |
| :---: | :---: | :---: |
| $1-50$ | 5,000 | $240 / 480$ |
| $51-200$ | 10,000 | $240 / 480$ |
| $201-400$ | 18,000 | $240 / 480$ |
| $401-600$ | 30,000 | $240 / 480$ |

## Drive Motor Overload Protection

Set parameter 02-01 (motor rated current) to the appropriate value to enable motor overload protection. The internal motor overload protection is UL listed and in accordance with the NEC and CEC.

## - 02-01 Motor Rated Current

## Setting Range: Model Dependent

Factory Default: Model Dependent
The motor rated current parameter (02-01) protects the motor and allows for proper vector control when using open loop vector or flux vector control methods ( $00-00=2$ or 3). The motor protection parameter $08-05$ is set as factory default. Set $02-01$ to the full load amps (FLA) stamped on the nameplate of the motor.
The operator must enter the rated current of the motor (17-02) in the menu during auto-tuning. If the auto-tuning operation completes successfully $(17-00=0)$, the value entered into $17-02$ will automatically write into 02-01.

## - 08-05 Motor Overload Protection Selection

The drive has an electronic overload protection function (OL1) based on time, output current, and output frequency, which protects the motor from overheating. The electronic thermal overload function is UL-recognized, so it does not require an external thermal overload relay for single motor operation.
This parameter selects the motor overload curve used according to the type of motor applied.
Overload Protection Settings

| Setting |  |
| :--- | :--- |
| $---0 B$ | Motor Overload Protection is disabled |
| $--1 B$ | Motor Overload Protection is enabled |
| $--0-B$ | Cold Start of Motor Overload |
| $-1-B$ | Hot Start of Motor Overload |
| $-0--B$ | Standard Motor |
| $-1--B$ | Special motor |

Sets the motor overload protection function in 08-05 according to the applicable motor.
Setting 08-05 = ---0B. Disables the motor overload protection function when two or more motors are connected to a single inverter. Use an alternative method to provide separate overload protection for each motor such as connecting a thermal overload relay to the power line of each motor.
Setting 08-05 = --1-B. The motor overload protection function should be set to hot start protection characteristic curve when the power supply is turned on and off frequently, because the thermal values are reset each time when the power is turned off.
Setting 08-05 = - $0--$ B. For motors without a forced cooling fan (general purpose standard motor), the heat dissipation capability is lower when in low speed operation.
Setting 08-05 = -1--B. For motors with a forced cooling fan (inverter duty or V/F motor), the heat dissipation capability is not dependent upon the rotating speed.

To protect the motor from overload by using electronic overload protection, be sure to set parameter 02-01 according to the rated current value shown on the motor nameplate.
Refer to the following "Motor Overload Protection Time" for the standard motor overload protection curve example : Setting 08-05 = -0--B.

- 08-06 Start-up mode of overload protection operation

| Setting |  |
| :---: | :--- |
| $\mathbf{0}$ | Stop Output after Overload Protection |
| $\mathbf{1}$ | Continuous Operation after Overload Protection |

08-06=0: When the inverter detects a motor overload the inverter output is turned off and the OL1 fault message will flash on the keypad. Press RESET button on the keypad or activate the reset function through the multi-function inputs to reset the OL1 fault.

08-06=1: When the inverter detects a motor overload the inverter will continue running and the OL1 alarm message will flash on the keypad until the motor current falls within the normal operating range.
Motor over temperature protection shall be provided in the end use application.
